Scan Report

April 15, 2026

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone "Coordinated Universal Time", which is abbreviated "UTC". The task was "meta3-ubu". The scan started at Wed Apr 15 04:06:09 2026 UTC and ended at Wed Apr 15 06:55:08 2026 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1 Result Overview **2**

1.1 Host Authentications . . . 2

2 Results per Host **2**

2.1 10.104.2.154 . . . 2

2.1.1 Critical package . . . 3

2.1.2 Critical 22/tcp . . . 147

2.1.3 Critical 21/tcp . . . 149

2.1.4 High package . . . 150

2.1.5 High 631/tcp . . . 511

2.1.6 High 6697/tcp . . . 515

2.1.7 High 21/tcp . . . 517

2.1.8 High 80/tcp . . . 519

2.1.9 Medium package . . . 520

2.1.10 Medium 22/tcp . . . 679

2.1.11 Medium 631/tcp . . . 683

2.1.12 Medium 21/tcp . . . 687

2.1.13 Medium 80/tcp . . . 688

2.1.14 Low package . . . 696

2.1.15 Low 22/tcp . . . 701

1 Result Overview

Host	Critical	High	Medium	Low	Log	False P.
10.104.2.154	112	240	164	7	0	0
Total: 1	112	240	164	7	0	0

Vendor security updates are not trusted.
Overrides are off. Even when a result has an override, this report uses the actual threat of the result.
Information on overrides is included in the report.
Notes are included in the report.
This report might not show details of all issues that were found.
Issues with the threat level "Log" are not shown.
Issues with the threat level "Debug" are not shown.
Issues with the threat level "False Positive" are not shown.
Only results with a minimum QoD of 70 are shown.

This report contains all 523 results selected by the filtering described above. Before filtering there were 1634 results.

1.1 Host Authentications

Host	Protocol	Result	Port/User
10.104.2.154	SSH	Success	Protocol SSH, Port 22, User vagrant
10.104.2.154	SMB	Success	Protocol SMB, Port 445, User

2 Results per Host

2.1 10.104.2.154

Host scan start	Wed Apr 15 04:06:50 2026 UTC
Host scan end	Wed Apr 15 06:55:02 2026 UTC

Service (Port)	Threat Level
package	Critical
22/tcp	Critical

package	Low
22/tcp	Low

2.1.1 Critical package

Critical (CVSS: 10.0)

NVT: Ubuntu: Security Advisory (USN-7826-2)

Summary
The remote host is missing an update for the 'samba' package(s) announced via the USN-7826-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   samba
Installed version:    samba-2:4.3.11+dfsg-0ubuntu0.14.04.20
Fixed version:      >=samba-2:4.3.11+dfsg-0ubuntu0.14.04.20+esm15
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'samba' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
USN-7826-1 fixed vulnerabilities in Samba. This update provides the corresponding update for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS and Ubuntu 20.04 LTS.
Original advisory details:
Andrew Walker discovered that Samba incorrectly initialized memory in the vfs_streams_xattr module. An authenticated attacker could possibly use this issue to obtain sensitive information. (CVE-2025-9640)
Igor Morgenstern discovered that Samba incorrectly handled names passed to the WINS hook program. An attacker could possibly use this issue to execute arbitrary code. (CVE-2025-10230)

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-4754-1)

Summary

The remote host is missing an update for the 'python2.7, python3.4, python3.5, python3.6, python3.8' package(s) announced via the USN-4754-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm8
Vulnerable package:   python2.7-minimal
Installed version:    python2.7-minimal-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-minimal-2.7.6-8ubuntu0.6+esm8
Vulnerable package:   python3.4
Installed version:    python3.4-3.4.3-1ubuntu1~14.04.7
Fixed version:      >=python3.4-3.4.3-1ubuntu1~14.04.7+esm10
Vulnerable package:   python3.4-minimal
Installed version:    python3.4-minimal-3.4.3-1ubuntu1~14.04.7
Fixed version:      >=python3.4-minimal-3.4.3-1ubuntu1~14.04.7+esm10
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'python2.7, python3.4, python3.5, python3.6, python3.8' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 20.10.

Vulnerability Insight
It was discovered that Python incorrectly handled certain inputs. An attacker could possibly use this issue to execute arbitrary code or cause a denial of service. (CVE-2020-27619, CVE-2021-3177)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-3360-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3360-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.125.135
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the Linux kernel did not properly initialize a Wake- on-Lan data structure. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2014-9900)
It was discovered that the Linux kernel did not properly restrict access to /proc/iomem. A local attacker could use this to expose sensitive information. (CVE-2015-8944)
It was discovered that a use-after-free vulnerability existed in the performance events and counters subsystem of the Linux kernel for ARM64. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2015-8955)
It was discovered that the SCSI generic (sg) driver in the Linux kernel contained a double-free vulnerability. A local attacker could use this to cause a denial of service (system crash). (CVE-2015-8962)
Sasha Levin discovered that a race condition existed in the performance events and counters subsystem of the Linux kernel when handling CPU unplug events. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2015-8963)

. . . continues on next page . . .

. . . continued from previous page . . .

Tilman Schmidt and Sasha Levin discovered a use-after-free condition in the TTY implementation in the Linux kernel. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2015-8964)
It was discovered that the fcntl64() system call in the Linux kernel did not properly set memory limits when returning on 32-bit ARM processors. A local attacker could use this to gain administrative privileges. (CVE-2015-8966)
It was discovered that the system call table for ARM 64-bit processors in the Linux kernel was not write-protected. An attacker could use this in conjunction with another kernel vulnerability to execute arbitrary code. (CVE-2015-8967)
It was discovered that the generic SCSI block layer in the Linux kernel did not properly restrict write operations in certain situations. A local attacker could use this to cause a denial of service (system crash) or possibly gain administrative privileges. (CVE-2016-10088)
Alexander Potapenko discovered a race condition in the Advanced Linux Sound Architecture (ALSA) subsystem in the Linux kernel. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2017-1000380)
Li Qiang discovered that the DRM driver for VMware Virtual GPUs in the Linux kernel did not properly validate some ioctl arguments. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-7346)
Tuomas Haanpaa and Ari Kauppi discovered that the NFSv2 and NFSv3 server implementations in the Linux kernel did not properly check for the end of buffer. A remote attacker could use this to craft requests that cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-7895)
It was discovered that an integer underflow existed in the Edgeport USB Serial ... [Please see the references for more information on the vulnerabilities]

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-6762-1)

Summary

The remote host is missing an update for the 'eglibc, glibc' package(s) announced via the USN-6762-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Vulnerable package:   libc6
Installed version:    libc6-2.19-0ubuntu6.15
Fixed version:      >=libc6-2.19-0ubuntu6.15+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'eglibc, glibc' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
It was discovered that GNU C Library incorrectly handled netgroup requests. An attacker could possibly use this issue to cause a crash or execute arbitrary code. This issue only affected Ubuntu 14.04 LTS. (CVE-2014-9984)
It was discovered that GNU C Library might allow context-dependent attackers to cause a denial of service. This issue only affected Ubuntu 14.04 LTS. (CVE-2015-20109)
It was discovered that GNU C Library when processing very long pathname arguments to the realpath function, could encounter an integer overflow on 32-bit architectures, leading to a stack-based buffer overflow and, potentially, arbitrary code execution. This issue only affected Ubuntu 14.04 LTS. (CVE-2018-11236)
It was discovered that the GNU C library getcwd function incorrectly handled buffers. An attacker could use this issue to cause the GNU C Library to crash, resulting in a denial of service, or possibly execute arbitrary code. This issue only affected Ubuntu 14.04 LTS. (CVE-2021-3999)
Charles Fol discovered that the GNU C Library iconv feature incorrectly handled certain input sequences. An attacker could use this issue to cause the GNU C Library to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2024-2961)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-4754-2)

Summary

The remote host is missing an update for the 'python2.7' package(s) announced via the USN-4754-2 advisory.

Quality of Detection (QoD): 97%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm9
Vulnerable package:   python2.7-minimal
Installed version:    python2.7-minimal-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-minimal-2.7.6-8ubuntu0.6+esm9
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-4754-1 fixed a vulnerability in Python. The fix for CVE-2021-3177 introduced a regression in Python 2.7. This update reverts the security fix pending further investigation.
We apologize for the inconvenience.
Original advisory details:
It was discovered that Python incorrectly handled certain inputs. An attacker could possibly use this issue to execute arbitrary code or cause a denial of service. (CVE-2020-27619, CVE-2021-3177)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4754-2)`

NVT: Ubuntu: Security Advisory (USN-5487-1)

Summary
The remote host is missing an update for the 'apache2' package(s) announced via the USN-5487-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   apache2
Installed version:    apache2-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-2.4.7-1ubuntu4.22+esm5
Vulnerable package:   apache2-bin
Installed version:    apache2-bin-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-bin-2.4.7-1ubuntu4.22+esm5
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'apache2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 21.10, Ubuntu 22.04.

Vulnerability Insight
It was discovered that Apache HTTP Server mod_proxy_ajp incorrectly handled certain crafted request. A remote attacker could possibly use this issue to perform an HTTP Request Smuggling attack. (CVE-2022-26377)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-28614)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a crash or expose sensitive information. (CVE-2022-28615)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-29404)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a crash. (CVE-2022-30522)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to execute arbitrary code or cause a crash. (CVE-2022-30556)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to bypass IP based authentication. (CVE-2022-31813)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-4218-1)

Summary

The remote host is missing an update for the 'eglibc' package(s) announced via the USN-4218-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libc6
Installed version:    libc6-2.19-0ubuntu6.15
Fixed version:      >=libc6-2.19-0ubuntu6.15+esm1
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'eglibc' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
Jakub Wilk discovered that GNU C Library incorrectly handled certain memory alignments. An attacker could possibly use this issue to execute arbitrary code or cause a crash.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-4704-1)

Summary
The remote host is missing an update for the 'libsndfile' package(s) announced via the USN-4704-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   libsndfile1
Installed version:    libsndfile1-1.0.25-7ubuntu2.2
Fixed version:      >=libsndfile1-1.0.25-7ubuntu2.2+esm1
```

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Please install the updated package(s).

Affected Software/OS
'libsndfile' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
It was discovered that libsndfile incorrectly handled certain malformed files. A remote attacker could use this issue to cause libsndfile to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2017-12562)
It was discovered that libsndfile incorrectly handled certain malformed files. A remote attacker could use this issue to cause libsndfile to crash, resulting in a denial of service, or possibly execute arbitrary code. This issue only affected Ubuntu 14.04 ESM. (CVE-2017-14245, CVE-2017-14246, CVE-2017-14634, CVE-2017-16942, CVE-2017-6892, CVE-2018-13139, CVE-2018-19432, CVE-2018-19661, CVE-2018-19662, CVE-2018-19758, CVE-2019-3832)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-8071-2)

Summary
The remote host is missing an update for the 'nss' package(s) announced via the USN-8071-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libnss3
Installed version:    libnss3-2:3.28.4-0ubuntu0.14.04.5
Fixed version:      >=libnss3-2:3.28.4-0ubuntu0.14.04.5+esm13
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'nss' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
USN-8071-1 fixed a vulnerability in nss. This update provides the corresponding fix for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS, and Ubuntu 20.04 LTS.
Original advisory details:
It was discovered that NSS incorrectly handled memory when performing certain GHASH operations. A remote attacker could use this issue to cause NSS to crash, resulting in a denial of service, or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7000-1)

Summary
The remote host is missing an update for the 'expat' package(s) announced via the USN-7000-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libexpat1
Installed version:    libexpat1-2.1.0-4ubuntu1.4
Fixed version:      >=libexpat1-2.1.0-4ubuntu1.4+esm9
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'expat' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 24.04.

Vulnerability Insight
Shang-Hung Wan discovered that Expat did not properly handle certain function calls when a negative input length was provided. An attacker could use this issue to cause a denial of service or possibly execute arbitrary code. (CVE-2024-45490)
Shang-Hung Wan discovered that Expat did not properly handle the potential for an integer overflow on 32-bit platforms. An attacker could use this issue to cause a denial of service or possibly execute arbitrary code. (CVE-2024-45491, CVE-2024-45492)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-3620-1)

Summary

The remote host is missing an update for the 'linux' package(s) announced via the USN-3620-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.144.154
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the netlink 802.11 configuration interface in the Linux kernel did not properly validate some attributes passed from userspace. A local attacker with the CAP_NET_ADMIN privilege could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-11089)
It was discovered that a buffer overflow existed in the ioctl handling code in the ISDN subsystem of the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-12762)
It was discovered that the netfilter component of the Linux did not properly restrict access to the connection tracking helpers list. A local attacker could use this to bypass intended access restrictions. (CVE-2017-17448)
Dmitry Vyukov discovered that the KVM implementation in the Linux kernel contained an out-of-bounds read when handling memory-mapped I/O. A local attacker could use this to expose sensitive information. (CVE-2017-17741)
It was discovered that the Salsa20 encryption algorithm implementations in the Linux kernel did not properly handle zero-length inputs. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-17805)
It was discovered that the keyring implementation in the Linux kernel did not properly check permissions when a key request was performed on a task's default keyring. A local attacker could use this to add keys to unauthorized keyrings. (CVE-2017-17807)
It was discovered that the Broadcom NetXtremeII ethernet driver in the Linux kernel did not properly validate Generic Segment Offload (GSO) packet sizes. An attacker could use this to cause a denial of service (interface unavailability). (CVE-2018-1000026)
It was discovered that the Reliable Datagram Socket (RDS) implementation in the Linux kernel contained an out-of-bounds write during RDMA page allocation. An attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-5332)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5787-2)

Summary
The remote host is missing an update for the 'libksba' package(s) announced via the USN-5787-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libksba8
Installed version:    libksba8-1.3.0-3ubuntu0.14.04.2
Fixed version:      >=libksba8-1.3.0-3ubuntu0.14.04.2+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libksba' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5787-1 fixed vulnerabilities in Libksba. This update provides the corresponding updates for Ubuntu 16.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that Libksba incorrectly handled parsing CRL signatures. A remote attacker could use this issue to cause Libksba to crash, resulting in a denial of service, or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-4019-2)

Summary
The remote host is missing an update for the 'sqlite3' package(s) announced via the USN-4019-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libsqlite3-0
Installed version:    libsqlite3-0-3.8.2-1ubuntu2.2
Fixed version:      >=libsqlite3-0-3.8.2-1ubuntu2.2+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'sqlite3' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4019-1 fixed several vulnerabilities in sqlite3. This update provides the corresponding update for Ubuntu 12.04 ESM and 14.04 ESM.
Original advisory details:
It was discovered that SQLite incorrectly handled certain SQL files. An attacker could possibly use this issue to execute arbitrary code or cause a denial of service. (CVE-2017-2518)
It was discovered that SQLite incorrectly handled certain queries. An attacker could possibly use this issue to execute arbitrary code. (CVE-2018-20346, CVE-2018-20506)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that SQLite incorrectly handled certain inputs. An attacker could possibly use this issue to access sensitive information. (CVE-2019-8457)
It was discovered that SQLite incorrectly handled certain inputs. An attacker could possibly use this issue to cause a denial of service. (CVE-2016-6153)
It was discovered that SQLite incorrectly handled certain databases. An attacker could possibly use this issue to access sensitive information. This issue only affected Ubuntu 14.04 LTS. (CVE-2017-10989)
It was discovered that SQLite incorrectly handled certain files. An attacker could possibly use this issue to cause a denial of service. (CVE-2017-13685)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7107-1)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'zlib' package(s) announced via the USN-7107-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   zlib1g
Installed version:    zlib1g-1:1.2.8.dfsg-1ubuntu1.1
Fixed version:      >=zlib1g-1:1.2.8.dfsg-1ubuntu1.1+esm3
Vulnerable package:   zlib1g-dev
Installed version:    zlib1g-dev-1:1.2.8.dfsg-1ubuntu1.1
Fixed version:      >=zlib1g-dev-1:1.2.8.dfsg-1ubuntu1.1+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'zlib' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that Minizip in zlib incorrectly handled certain zip header fields. An attacker could possibly use this issue to cause a denial of service, or execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6242-2)

Summary
The remote host is missing an update for the 'openssh' package(s) announced via the USN-6242-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   openssh-client
Installed version:    openssh-client-1:6.6p1-2ubuntu2.13
Fixed version:      >=openssh-client-1:6.6p1-2ubuntu2.13+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'openssh' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6242-1 fixed a vulnerability in OpenSSH. This update provides the corresponding update for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, and Ubuntu 18.04 LTS.
Original advisory details:
It was discovered that OpenSSH incorrectly handled loading certain PKCS#11 providers. If a user forwarded their ssh-agent to an untrusted system, a remote attacker could possibly use this issue to load arbitrary libraries from the user's system and execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5825-1)

Summary
The remote host is missing an update for the 'pam' package(s) announced via the USN-5825-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libpam-modules
Installed version:    libpam-modules-1.1.8-1ubuntu2.2
Fixed version:      >=libpam-modules-1.1.8-1ubuntu2.2+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'pam' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10.

Vulnerability Insight
It was discovered that PAM did not correctly restrict login from an IP address that is not resolvable via DNS. An attacker could possibly use this issue to bypass authentication.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5825-1)`
OID:1.3.6.1.4.1.25623.1.1.12.2023.5825.1

advisory_id: USN-5825-1

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5288-1)

Summary
The remote host is missing an update for the 'expat' package(s) announced via the USN-5288-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libexpat1
Installed version:    libexpat1-2.1.0-4ubuntu1.4
Fixed version:      >=libexpat1-2.1.0-4ubuntu1.4+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'expat' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 21.10.

Vulnerability Insight
It was discovered that Expat incorrectly handled certain files. An attacker could possibly use this issue to cause a crash or execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5333-2)

Summary

The remote host is missing an update for the 'apache2' package(s) announced via the USN-5333-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:    apache2
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version:    apache2-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-2.4.7-1ubuntu4.22+esm4
Vulnerable package:   apache2-bin
Installed version:    apache2-bin-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-bin-2.4.7-1ubuntu4.22+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'apache2' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5333-1 fixed several vulnerabilities in Apache. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
Chamal De Silva discovered that the Apache HTTP Server mod_lua module incorrectly handled certain crafted request bodies. A remote attacker could possibly use this issue to cause the server to crash, resulting in a denial of service. (CVE-2022-22719)
James Kettle discovered that the Apache HTTP Server incorrectly closed inbound connection when certain errors are encountered. A remote attacker could possibly use this issue to perform an HTTP Request Smuggling attack. (CVE-2022-22720)
It was discovered that the Apache HTTP Server incorrectly handled large LimitXMLRequestBody settings on certain platforms. In certain configurations, a remote attacker could use this issue to cause the server to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2022-22721)
Ronald Crane discovered that the Apache HTTP Server mod_sed module incorrectly handled memory. A remote attacker could use this issue to cause the server to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2022-23943)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-3583-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3583-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.142.152
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that an out-of-bounds write vulnerability existed in the Flash-Friendly File System (f2fs) in the Linux kernel. An attacker could construct a malicious file system that, when mounted, could cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-0750)
It was discovered that a race condition leading to a use-after-free vulnerability existed in the ALSA PCM subsystem of the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-0861)
It was discovered that the KVM implementation in the Linux kernel allowed passthrough of the diagnostic I/O port 0x80. An attacker in a guest VM could use this to cause a denial of service (system crash) in the host OS. (CVE-2017-1000407)
Bo Zhang discovered that the netlink wireless configuration interface in the Linux kernel did not properly validate attributes when handling certain requests. A local attacker with the CAP_NET_ADMIN could use this to cause a denial of service (system crash). (CVE-2017-12153)
Vitaly Mayatskikh discovered that the SCSI subsystem in the Linux kernel did not properly track reference counts when merging buffers. A local attacker could use this to cause a denial of service (memory exhaustion). (CVE-2017-12190)
It was discovered that the key management subsystem in the Linux kernel did not properly restrict key reads on negatively instantiated keys. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-12192)
It was discovered that an integer overflow existed in the sysfs interface for the QLogic 24xx+ series SCSI driver in the Linux kernel. A local privileged attacker could use this to cause a denial of service (system crash). (CVE-2017-14051)
Otto Ebeling discovered that the memory manager in the Linux kernel did not properly check the effective UID in some situations. A local attacker could use this to expose sensitive information. (CVE-2017-14140)
It was discovered that the ATI Radeon framebuffer driver in the Linux kernel did not properly initialize a data structure returned to user space. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2017-14156)
ChunYu Wang discovered that the iSCSI transport implementation in the Linux kernel did not properly validate data structures. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-14489)
James Patrick-Evans discovered a race condition in the LEGO USB Infrared Tower driver in the Linux kernel. A physically proximate attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-15102)
ChunYu Wang discovered that a use-after-free vulnerability existed in the SCTP protocol implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system ... [Please see the references for more information on the vulnerabilities]

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5702-2)

Summary
The remote host is missing an update for the 'curl' package(s) announced via the USN-5702-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm13
Vulnerable package:   libcurl3
Installed version:    libcurl3-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm13
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm13
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5702-1 fixed a vulnerability in curl. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
Robby Simpson discovered that curl incorrectly handled certain POST operations after PUT operations. This issue could cause applications using curl to send the wrong data, perform incorrect memory operations, or crash. (CVE-2022-32221)

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-7959-1)

Summary

The remote host is missing an update for the 'klibc' package(s) announced via the USN-7959-1 advisory.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   klibc-utils
Installed version:    klibc-utils-2.0.3-0ubuntu1
Fixed version:      >=klibc-utils-2.0.3-0ubuntu1.14.04.3+esm4
Vulnerable package:   libklibc
Installed version:    libklibc-2.0.3-0ubuntu1
Fixed version:      >=libklibc-2.0.3-0ubuntu1.14.04.3+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'klibc' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.04, Ubuntu 25.10.

Vulnerability Insight
It was discovered that zlib, vendored in klibc, did not properly handle integer arithmetic. An attacker could possibly use this issue to execute arbitrary code or cause a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-7582-2)

Summary
The remote host is missing an update for the 'samba' package(s) announced via the USN-7582-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   samba
Installed version:    samba-2:4.3.11+dfsg-0ubuntu0.14.04.20
Fixed version:      >=samba-2:4.3.11+dfsg-0ubuntu0.14.04.20+esm14
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'samba' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-7582-1 fixed vulnerabilities in Samba. The update introduced a regression. This update fixes the problem.
We apologize for the inconvenience.
Original advisory details:
Evgeny Legerov discovered that Samba incorrectly handled buffers in certain GSSAPI routines of Heimdal. A remote attacker could possibly use this issue to cause Samba to crash, resulting in a denial of service. (CVE-2022-3437)
Greg Hudson discovered that Samba incorrectly handled PAC parsing. On 32-bit systems, a remote attacker could use this issue to escalate privileges, or possibly execute arbitrary code. (CVE-2022-42898)
Joseph Sutton discovered that Samba could be forced to issue rc4-hmac encrypted Kerberos tickets. A remote attacker could possibly use this issue to escalate privileges. This issue only affected Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2022-45141)
Florent Saudel discovered that Samba incorrectly handled certain Spotlight requests. A remote attacker could possibly use this issue to cause Samba to consume resources, leading to a denial of service. (CVE-2023-34966)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Vulnerable package:   ncurses-bin
Installed version:    ncurses-bin-5.9+20140118-1ubuntu1
Fixed version:      >=ncurses-bin-5.9+20140118-1ubuntu1+esm1
Vulnerable package:   ncurses-term
Installed version:    ncurses-term-5.9+20140118-1ubuntu1
Fixed version:      >=ncurses-term-5.9+20140118-1ubuntu1+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'ncurses' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
It was discovered that ncurses was not properly checking array bounds when executing the fmt_entry function, which could result in an out-of-bounds write. An attacker could possibly use this issue to execute arbitrary code. (CVE-2017-10684)
It was discovered that ncurses was not properly checking user input, which could result in it being treated as a format argument. An attacker could possibly use this issue to expose sensitive information or to execute arbitrary code. (CVE-2017-10685)
It was discovered that ncurses was incorrectly performing memory management operations and was not blocking access attempts to illegal memory locations. An attacker could possibly use this issue to cause a denial of service. (CVE-2017-11112, CVE-2017-13729, CVE-2017-13730, CVE-2017-13731, CVE-2017-13732, CVE-2017-13733, CVE-2017-13734)
It was discovered that ncurses was not properly performing checks on pointer values before attempting to access the related memory locations, which could lead to NULL pointer dereferencing. An attacker could possibly use this issue to cause a denial of service. (CVE-2017-11113)
It was discovered that ncurses was incorrectly handling loops in libtic, which could lead to the execution of an infinite loop. An attacker could possibly use this issue to cause a denial of service. (CVE-2017-13728)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5320-1)

Summary
The remote host is missing an update for the 'expat' package(s) announced via the USN-5320-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libexpat1
Installed version:    libexpat1-2.1.0-4ubuntu1.4
Fixed version:      >=libexpat1-2.1.0-4ubuntu1.4+esm6
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'expat' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 21.10.

Vulnerability Insight
USN-5288-1 fixed several vulnerabilities in Expat. For CVE-2022-25236 it caused a regression and an additional patch was required. This update address this regression and several other vulnerabilities.
It was discovered that Expat incorrectly handled certain files. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-25313)
It was discovered that Expat incorrectly handled certain files. An attacker could possibly use this issue to cause a crash or execute arbitrary code. This issue only affected Ubuntu 18.04 LTS, Ubuntu 20.04 LTS, and Ubuntu 21.10. (CVE-2022-25314)
It was discovered that Expat incorrectly handled certain files. An attacker could possibly use this issue to cause a crash or execute arbitrary code. (CVE-2022-25315)
Original advisory details:
It was discovered that Expat incorrectly handled certain files. An attacker could possibly use this issue to cause a crash or execute arbitrary code. (CVE-2022-25236)

NVT: Ubuntu: Security Advisory (USN-4288-2)

Summary
The remote host is missing an update for the 'ppp' package(s) announced via the USN-4288-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   ppp
Installed version:    ppp-2.4.5-5.1ubuntu2.3
Fixed version:      >=ppp-2.4.5-5.1ubuntu2.3+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'ppp' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4288-1 fixed a vulnerability in ppp. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that ppp incorrectly handled certain rhostname values. A remote attacker could use this issue to cause ppp to crash, resulting in a denial of service, or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Fixed version:      >=python3.4-minimal-3.4.3-1ubuntu1~14.04.7+esm2
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'python2.7, python3.4' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

USN-4127-1 fixed several vulnerabilities in Python. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that Python incorrectly handled certain pickle files. An attacker could possibly use this issue to consume memory, leading to a denial of service. This issue only affected Ubuntu 14.04 ESM. (CVE-2018-20406)
It was discovered that Python incorrectly validated the domain when handling cookies. An attacker could possibly trick Python into sending cookies to the wrong domain. (CVE-2018-20852)
Jonathan Birch and Panayiotis Panayiotou discovered that Python incorrectly handled Unicode encoding during NFKC normalization. An attacker could possibly use this issue to obtain sensitive information. (CVE-2019-9636, CVE-2019-10160)
Colin Read and Nicolas Edet discovered that Python incorrectly handled parsing certain X509 certificates. An attacker could possibly use this issue to cause Python to crash, resulting in a denial of service. This issue only affected Ubuntu 14.04 ESM. (CVE-2019-5010)
It was discovered that Python incorrectly handled certain urls. A remote attacker could possibly use this issue to perform CRLF injection attacks. (CVE-2019-9740, CVE-2019-9947)
Sihoon Lee discovered that Python incorrectly handled the local_file: scheme. A remote attacker could possibly use this issue to bypass blocklist meschanisms. (CVE-2019-9948)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5688-1)

Summary
The remote host is missing an update for the 'libksba' package(s) announced via the USN-5688-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libksba8
Installed version:    libksba8-1.3.0-3ubuntu0.14.04.2
Fixed version:      >=libksba8-1.3.0-3ubuntu0.14.04.2+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libksba' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
It was discovered that an integer overflow could be triggered in Libksba when decoding certain data. An attacker could use this issue to cause a denial of service (application crash) or possibly execute arbitrary code.

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable package version is present on the target host.

Vulnerable package:   rsync
Installed version:    rsync-3.1.0-2ubuntu0.4
Fixed version:      >=rsync-3.1.0-2ubuntu0.4+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'rsync' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04.

Vulnerability Insight
Simon Scannell, Pedro Gallegos, and Jasiel Spelman discovered that rsync did not properly handle checksum lengths. An attacker could use this issue to execute arbitrary code. (CVE-2024-12084)

. . . continues on next page . . .

. . . continued from previous page . . .

Simon Scannell, Pedro Gallegos, and Jasiel Spelman discovered that rsync compared checksums with uninitialized memory. An attacker could exploit this issue to leak sensitive information. (CVE-2024-12085)
Simon Scannell, Pedro Gallegos, and Jasiel Spelman discovered that rsync incorrectly handled file checksums. A malicious server could use this to expose arbitrary client files. (CVE-2024-12086)
Simon Scannell, Pedro Gallegos, and Jasiel Spelman discovered that rsync mishandled symlinks for some settings. An attacker could exploit this to write files outside the intended directory. (CVE-2024-12087)
Simon Scannell, Pedro Gallegos, and Jasiel Spelman discovered that rsync failed to verify symbolic link destinations for some settings. An attacker could exploit this for path traversal attacks. (CVE-2024-12088)
Aleksei Gorban discovered a race condition in rsync's handling of symbolic links. An attacker could use this to access sensitive information or escalate privileges. (CVE-2024-12747)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-4004-2)

Summary
The remote host is missing an update for the 'db5.3' package(s) announced via the USN-4004-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libdb5.3
Installed version:    libdb5.3-5.3.28-3ubuntu3.1
Fixed version:      >=libdb5.3-5.3.28-3ubuntu3.1+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'db5.3' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4004-1 fixed a vulnerability in Berkeley DB. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that Berkeley DB incorrectly handled certain inputs. An attacker could possibly use this issue to read sensitive information.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5487-3)

Summary
The remote host is missing an update for the 'apache2' package(s) announced via the USN-5487-3 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   apache2
Installed version:    apache2-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-2.4.7-1ubuntu4.22+esm8
Vulnerable package:   apache2-bin
Installed version:    apache2-bin-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-bin-2.4.7-1ubuntu4.22+esm8
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'apache2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-5487-1 fixed several vulnerabilities in Apache HTTP Server. Unfortunately it caused regressions. USN-5487-2 reverted the patches that caused the regression in Ubuntu 14.04 ESM for further investigation. This update re-adds the security fixes for Ubuntu 14.04 ESM and fixes two different regressions: one affecting mod_proxy only in Ubuntu 14.04 ESM and another in mod_sed affecting also Ubuntu 16.04 ESM and Ubuntu 18.04 LTS.
We apologize for the inconvenience.
Original advisory details:
It was discovered that Apache HTTP Server mod_proxy_ajp incorrectly handled certain crafted request. A remote attacker could possibly use this issue to perform an HTTP Request Smuggling attack. (CVE-2022-26377)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-28614)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a crash or expose sensitive information. (CVE-2022-28615)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-29404)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a crash. (CVE-2022-30522)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to execute arbitrary code or cause a crash. (CVE-2022-30556)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to bypass IP based authentication. (CVE-2022-31813)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

'glib2.0' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight

USN-7942-1 fixed vulnerabilities in GLib. This update provides the corresponding updates for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS, and Ubuntu 20.04 LTS. CVE-2025-3360 only affected Ubuntu 18.04 LTS and Ubuntu 20.04 LTS.

Original advisory details:

It was discovered that GLib incorrectly handled escaping URI strings. An attacker could use this issue to cause GLib to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2025-13601)

It was discovered that GLib incorrectly parsed certain GVariants. An attacker could use this issue to cause GLib to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2025-14087)

It was discovered that GLib incorrectly parsed certain long invalid ISO 8601 timestamps. An attacker could possibly use this issue to cause GLib to crash, resulting in a denial of service. This issue only affected Ubuntu 22.04 LTS and Ubuntu 24.04 LTS. (CVE-2025-3360)

It was discovered that GLib incorrectly handled GString memory operations. An attacker could use this issue to cause GLib to crash, resulting in a denial of service, or possibly execute arbitrary code. This issue only affected Ubuntu 24.04 LTS and Ubuntu 25.04. (CVE-2025-6052)

It was discovered that GLib incorrectly handled creating temporary files. An attacker could possibly use this issue to access unauthorized data. This issue only affected Ubuntu 22.04 LTS, Ubuntu 24.04 LTS, and Ubuntu 25.04. (CVE-2025-7039)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4309-1)

Summary
The remote host is missing an update for the 'vim' package(s) announced via the USN-4309-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   vim-common
Installed version:    vim-common-2:7.4.052-1ubuntu3.1
Fixed version:      >=vim-common-2:7.4.052-1ubuntu3.1+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'vim' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 19.10.

Vulnerability Insight
It was discovered that Vim incorrectly handled certain sources. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 12.04 ESM, Ubuntu 14.04 ESM and Ubuntu 16.04 LTS (CVE-2017-11109)
It was discovered that Vim incorrectly handled certain files. An attacker could possibly use this issue to execute arbitrary code. This issue only affected Ubuntu 12.04 ESM and Ubuntu 14.04 ESM. (CVE-2017-5953)
It was discovered that Vim incorrectly handled certain inputs. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 16.06 LTS. (CVE-2018-20786)

NVT: Ubuntu: Security Advisory (USN-5090-2)

Summary
The remote host is missing an update for the 'apache2' package(s) announced via the USN-5090-2 advisory.

Quality of Detection (QoD): 97%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Vulnerable package:   apache2
Installed version:    apache2-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-2.4.7-1ubuntu4.22+esm2
Vulnerable package:   apache2-bin
Installed version:    apache2-bin-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-bin-2.4.7-1ubuntu4.22+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'apache2' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5090-1 fixed several vulnerabilities in Apache. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
It was discovered that the Apache HTTP Server incorrectly handled certain malformed requests. A remote attacker could possibly use this issue to cause the server to crash, resulting in a denial of service. (CVE-2021-34798)
It was discovered that the Apache HTTP Server incorrectly handled escaping quotes. If the server was configured with third-party modules, a remote attacker could use this issue to cause the server to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2021-39275)
It was discovered that the Apache mod_proxy module incorrectly handled certain request uri-paths. A remote attacker could possibly use this issue to cause the server to forward requests to arbitrary origin servers. (CVE-2021-40438)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-4231-1)

Summary

The remote host is missing an update for the 'nss' package(s) announced via the USN-4231-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libnss3
Installed version:    libnss3-2:3.28.4-0ubuntu0.14.04.5
Fixed version:      >=libnss3-2:3.28.4-0ubuntu0.14.04.5+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

'nss' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 19.04, Ubuntu 19.10.

Vulnerability Insight
It was discovered that NSS incorrectly handled certain inputs. An attacker could possibly use this issue to execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4231-1)`

NVT: Ubuntu: Security Advisory (USN-5168-3)

Summary
The remote host is missing an update for the 'nss' package(s) announced via the USN-5168-3 advisory.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libnss3
Installed version:    libnss3-2:3.28.4-0ubuntu0.14.04.5
Fixed version:      >=libnss3-2:3.28.4-0ubuntu0.14.04.5+esm9
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'nss' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5168-1 fixed a vulnerability in NSS. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
Tavis Ormandy discovered that NSS incorrectly handled verifying DSA/RSA-PSS signatures. A remote attacker could use this issue to cause NSS to crash, resulting in a denial of service, or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5168-4)

Summary
The remote host is missing an update for the 'nss' package(s) announced via the USN-5168-4 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libnss3
Installed version:    libnss3-2:3.28.4-0ubuntu0.14.04.5
Fixed version:      >=libnss3-2:3.28.4-0ubuntu0.14.04.5+esm10
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'nss' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5168-3 fixed a vulnerability in NSS. Unfortunately that update introduced a regression that could break SSL connections. This update fixes the problem.
We apologize for the inconvenience.
Original advisory details:
Tavis Ormandy discovered that NSS incorrectly handled verifying DSA/RSA-PSS signatures. A remote attacker could use this issue to cause NSS to crash, resulting in a denial of service, or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7302-1)

Summary
The remote host is missing an update for the 'libxml2' package(s) announced via the USN-7302-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxml2
Installed version:    libxml2-2.9.1+dfsg1-3ubuntu4.13
Fixed version:      >=libxml2-2.9.1+dfsg1-3ubuntu4.13+esm7
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxml2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 24.10.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight

It was discovered that libxml2 incorrectly handled certain memory operations. A remote attacker could use this issue to cause libxml2 to crash, resulting in a denial of service, or possibly execute arbitrary code. This issue only affected Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, and Ubuntu 18.04 LTS. (CVE-2022-49043)

It was discovered that the libxml2 xmllint tool incorrectly handled certain memory operations. If a user or automated system were tricked into running xmllint on a specially crafted xml file, a remote attacker could cause xmllint to crash, resulting in a denial of service. This issue only affected Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, and Ubuntu 18.04 LTS. (CVE-2024-34459)

It was discovered that libxml2 did not properly manage memory. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2024-56171)

It was discovered that libxml2 could be made to write out of bounds. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2025-24928)

It was discovered that libxml2 could be made to dereference invalid memory. An attacker could possibly use this issue to cause a denial of service. (CVE-2025-27113)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6335-1)

Summary

The remote host is missing an update for the 'busybox' package(s) announced via the USN-6335-1 advisory.

Quality of Detection (QoD): 97%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Vulnerable package:   busybox-initramfs
Installed version:    busybox-initramfs-1:1.21.0-1ubuntu1.4
Fixed version:      >=busybox-initramfs-1:1.21.0-1ubuntu1.4+esm1
Vulnerable package:   busybox-static
Installed version:    busybox-static-1:1.21.0-1ubuntu1.4
Fixed version:      >=busybox-static-1:1.21.0-1ubuntu1.4+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'busybox' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
It was discovered that BusyBox incorrectly handled certain malformed gzip archives. If a user or automated system were tricked into processing a specially crafted gzip archive, a remote attacker could use this issue to cause BusyBox to crash, resulting in a denial of service, or execute arbitrary code. This issue only affected Ubuntu 14.04 LTS. (CVE-2021-28831)
It was discovered that BusyBox did not properly validate user input when performing certain arithmetic operations. If a user or automated system were tricked into processing a specially crafted file, an attacker could possibly use this issue to cause BusyBox to crash, resulting in a denial of service, or execute arbitrary code. (CVE-2022-48174)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-3754-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3754-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.157.167
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Ralf Spenneberg discovered that the ext4 implementation in the Linux kernel did not properly validate meta block groups. An attacker with physical access could use this to specially craft an ext4 image that causes a denial of service (system crash). (CVE-2016-10208)
It was discovered that an information disclosure vulnerability existed in the ACPI implementation of the Linux kernel. A local attacker could use this to expose sensitive information (kernel memory addresses). (CVE-2017-11472)
It was discovered that a buffer overflow existed in the ACPI table parsing implementation in the Linux kernel. A local attacker could use this to construct a malicious ACPI table that, when loaded, caused a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-11473)
It was discovered that the generic SCSI driver in the Linux kernel did not properly initialize data returned to user space in some situations. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2017-14991)
It was discovered that a race condition existed in the packet fanout implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-15649)

. . . continues on next page . . .

. . . continued from previous page . . .

Andrey Konovalov discovered that the Ultra Wide Band driver in the Linux kernel did not properly check for an error condition. A physically proximate attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-16526)
Andrey Konovalov discovered that the ALSA subsystem in the Linux kernel contained a use-after-free vulnerability. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-16527)
Andrey Konovalov discovered that the ALSA subsystem in the Linux kernel did not properly validate USB audio buffer descriptors. A physically proximate attacker could use this cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-16529)
Andrey Konovalov discovered that the USB subsystem in the Linux kernel did not properly validate USB interface association descriptors. A physically proximate attacker could use this to cause a denial of service (system crash). (CVE-2017-16531)
Andrey Konovalov discovered that the usbtest device driver in the Linux kernel did not properly validate endpoint metadata. A physically proximate attacker could use this to cause a denial of service (system crash). (CVE-2017-16532)
Andrey Konovalov discovered that the USB subsystem in the Linux kernel did not properly validate USB HID descriptors. A physically proximate attacker could use this to cause a denial of service (system crash). (CVE-2017-16533)
Andrey Konovalov discovered that the USB subsystem in the Linux kernel did not properly validate USB BOS metadata. A physically proximate attacker could use this ... [Please see the references for more information on the vulnerabilities]

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5487-2)

Summary

The remote host is missing an update for the 'apache2' package(s) announced via the USN-5487-2 advisory.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   apache2
Installed version:    apache2-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-2.4.7-1ubuntu4.22+esm6
Vulnerable package:   apache2-bin
Installed version:    apache2-bin-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-bin-2.4.7-1ubuntu4.22+esm6
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'apache2' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-5487-1 fixed several vulnerabilities in Apache. Unfortunately, that update introduced a regression when proxying balancer manager connections in some configurations on Ubuntu 14.04 ESM. This update reverts those changes till further fix.
We apologize for the inconvenience.
Original advisory details:
It was discovered that Apache HTTP Server mod_proxy_ajp incorrectly handled certain crafted request. A remote attacker could possibly use this issue to perform an HTTP Request Smuggling attack. (CVE-2022-26377)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-28614)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a crash or expose sensitive information. (CVE-2022-28615)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-29404)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to cause a crash. (CVE-2022-30522)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to execute arbitrary code or cause a crash. (CVE-2022-30556)
It was discovered that Apache HTTP Server incorrectly handled certain request. An attacker could possibly use this issue to bypass IP based authentication. (CVE-2022-31813)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5487-2)`

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5379-1)

Summary

The remote host is missing an update for the 'klibc' package(s) announced via the USN-5379-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:    klibc-utils
Installed version:     klibc-utils-2.0.3-0ubuntu1
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:      >=klibc-utils-2.0.3-0ubuntu1.14.04.3+esm2
Vulnerable package:   libklibc
Installed version:    libklibc-2.0.3-0ubuntu1
Fixed version:      >=libklibc-2.0.3-0ubuntu1.14.04.3+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'klibc' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
It was discovered that klibc did not properly perform some mathematical operations, leading to an integer overflow. An attacker could possibly use this issue to cause a crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2021-31870)
It was discovered that klibc did not properly handled some memory allocations on 64 bit systems. An attacker could possibly use this issue to cause a crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2021-31871)
It was discovered that klibc did not properly handled some file sizes values on 32 bit systems. An attacker could possibly use this issue to cause a crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2021-31872)
It was discovered that klibc did not properly handled some memory allocations. An attacker could possibly use this issue to cause a crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2021-31873)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5379-1)`
OID:1.3.6.1.4.1.25623.1.1.12.2022.5379.1

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-7417-1)

Summary
The remote host is missing an update for the 'libdbd-mysql-perl' package(s) announced via the USN-7417-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libdbd-mysql-perl
Installed version:    libdbd-mysql-perl-4.025-1ubuntu0.1
Fixed version:      >=libdbd-mysql-perl-4.025-1ubuntu0.1+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libdbd-mysql-perl' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that libdbd-mysql-perl did not correctly handle certain SQL queries. An attacker could possibly use this issue to cause a denial of service. (CVE-2016-1249)
It was discovered that libdbd-mysql-perl did not correctly handle certain memory operations, which could lead to a use-after-free vulnerability. A remote attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2016-1251, CVE-2017-10788)
It was discovered that libdbd-mysql-perl did not properly enforce SSL connections depending on the mysql_ssl setting. A machine-in-the-middle attacker could possibly use this issue to spoof servers. (CVE-2017-10789)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4754-5)

Summary
The remote host is missing an update for the 'python2.7' package(s) announced via the USN-4754-5 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm10
Vulnerable package:   python2.7-minimal
Installed version:    python2.7-minimal-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-minimal-2.7.6-8ubuntu0.6+esm10
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4754-1 fixed vulnerabilities in Python. Because of a regression, a subsequent update removed the fix for CVE-2021-3177. This update reinstates the security fix for CVE-2021-3177 in Ubuntu 14.04 ESM.
Original advisory details:

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that Python incorrectly handled certain inputs. An attacker could possibly use this issue to execute arbitrary code or cause a denial of service. (CVE-2020-27619, CVE-2021-3177)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5254-1)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'shadow' package(s) announced via the USN-5254-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   login
Installed version:    login-1:4.1.5.1-1ubuntu9.5
Fixed version:      >=login-1:4.1.5.1-1ubuntu9.5+esm1
Vulnerable package:   passwd
Installed version:    passwd-1:4.1.5.1-1ubuntu9.5
Fixed version:      >=passwd-1:4.1.5.1-1ubuntu9.5+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'shadow' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
It was discovered that shadow incorrectly handled certain inputs. An attacker could possibly use this issue to cause a crash or expose sensitive information. This issue only affected Ubuntu 14.04 ESM and Ubuntu 16.04 ESM. (CVE-2017-12424)
It was discovered that shadow incorrectly handled certain inputs. An attacker could possibly use this issue to expose sensitive information. (CVE-2018-7169)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-7582-1)

Summary
The remote host is missing an update for the 'samba' package(s) announced via the USN-7582-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   samba
Installed version:    samba-2:4.3.11+dfsg-0ubuntu0.14.04.20
Fixed version:      >=samba-2:4.3.11+dfsg-0ubuntu0.14.04.20+esm13
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'samba' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
Evgeny Legerov discovered that Samba incorrectly handled buffers in certain GSSAPI routines of Heimdal. A remote attacker could possibly use this issue to cause Samba to crash, resulting in a denial of service. (CVE-2022-3437)
Greg Hudson discovered that Samba incorrectly handled PAC parsing. On 32-bit systems, a remote attacker could use this issue to escalate privileges, or possibly execute arbitrary code. (CVE-2022-42898)
Joseph Sutton discovered that Samba could be forced to issue rc4-hmac encrypted Kerberos tickets. A remote attacker could possibly use this issue to escalate privileges. This issue only affected Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2022-45141)
Florent Saudel discovered that Samba incorrectly handled certain Spotlight requests. A remote attacker could possibly use this issue to cause Samba to consume resources, leading to a denial of service. (CVE-2023-34966)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-7582-1)`

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-5825-2)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'pam' package(s) announced via the USN-5825-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libpam-modules
Installed version:    libpam-modules-1.1.8-1ubuntu2.2
Fixed version:      >=libpam-modules-1.1.8-1ubuntu2.2+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'pam' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10.

Vulnerability Insight
USN-5825-1 fixed vulnerabilities in PAM. Unfortunately that update was incomplete and could introduce a regression. This update fixes the problem.
We apologize for the inconvenience.
Original advisory details:
It was discovered that PAM did not correctly restrict login from an IP address that is not resolvable via DNS. An attacker could possibly use this issue to bypass authentication.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5825-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2023.5825.2
Version used: `2024-02-02T04:09:01Z`

Critical (CVSS: 9.8)

NVT: Ubuntu: Security Advisory (USN-4994-2)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'apache2' package(s) announced via the USN-4994-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   apache2
Installed version:    apache2-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-2.4.7-1ubuntu4.22+esm1
Vulnerable package:   apache2-bin
Installed version:    apache2-bin-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-bin-2.4.7-1ubuntu4.22+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'apache2' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-4994-1 fixed several vulnerabilities in Apache. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
Antonio Morales discovered that the Apache mod_auth_digest module incorrectly handled certain Digest nonces. A remote attacker could possibly use this issue to cause Apache to crash, resulting in a denial of service. (CVE-2020-35452)
Antonio Morales discovered that the Apache mod_session module incorrectly handled certain Cookie headers. A remote attacker could possibly use this issue to cause Apache to crash, resulting in a denial of service. (CVE-2021-26690)
Christophe Jaillet discovered that the Apache mod_session module incorrectly handled certain SessionHeader values. A remote attacker could use this issue to cause Apache to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2021-26691)
Christoph Anton Mitterer discovered that the new MergeSlashes configuration option resulted in unexpected behaviour in certain situations. (CVE-2021-30641)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4994-2)`

Summary
The remote host is missing an update for the 'apache2' package(s) announced via the USN-6885-5 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   apache2
Installed version:    apache2-2.4.7-1ubuntu4.22
Fixed version:      >=apache2-2.4.7-1ubuntu4.22+esm10
```

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Please install the updated package(s).

Affected Software/OS
'apache2' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-6885-1 fixed vulnerabilities in Apache. This update provides the corresponding updates for Ubuntu 14.04 LTS.
Original advisory details:
Orange Tsai discovered that the Apache HTTP Server mod_rewrite module incorrectly handled certain substitutions. A remote attacker could possibly use this issue to execute scripts in directories not directly reachable by any URL, or cause a denial of service. Some environments may require using the new UnsafeAllow3F flag to handle unsafe substitutions. (CVE-2024-38474, CVE-2024-38475)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4593-2)

Summary
The remote host is missing an update for the 'freetype' package(s) announced via the USN-4593-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libfreetype6
Installed version:    libfreetype6-2.5.2-1ubuntu2.8
Fixed version:      >=libfreetype6-2.5.2-1ubuntu2.8+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'freetype' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4593-1 fixed a vulnerability in FreeType. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
Sergei Glazunov discovered that FreeType did not correctly handle certain malformed font files. If a user were tricked into using a specially crafted font file, a remote attacker could cause FreeType to crash or possibly execute arbitrary code with user privileges.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

. . . continued from previous page . . .

The remote host is missing an update for the 'libtasn1-6' package(s) announced via the USN-7954-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libtasn1-6
Installed version:    libtasn1-6-3.4-3ubuntu0.6
Fixed version:      >=libtasn1-6-3.4-3ubuntu0.6+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libtasn1-6' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
USN-7954-1 fixed vulnerabilities in Libtasn1. This update provides the corresponding updates for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS, and Ubuntu 20.04 LTS. CVE-2021-46848 only affected Ubuntu 14.04 LTS, Ubuntu 18.04 LTS, and Ubuntu 20.04 LTS.
Original advisory details:
It was discovered that Libtasn1 incorrectly handled decoding ASN.1 content. An attacker could possibly use this issue to cause Libtasn1 to crash, resulting in a denial of service. (CVE-2025-13151)
It was discovered that Libtasn1 incorrectly handled encoding ASN.1 content. An attacker could possibly use this issue to cause Libtasn1 to crash, resulting in a denial of service. This issue only affected Ubuntu 22.04 LTS. (CVE-2021-46848)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7249-1)

Summary
The remote host is missing an update for the 'libvpx' package(s) announced via the USN-7249-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libvpx1
Installed version:    libvpx1-1.3.0-2
Fixed version:      >=libvpx1-1.3.0-2ubuntu0.1+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libvpx' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
Xiantong Hou discovered that libvpx would overflow when attempting to allocate memory for very large images. If an application using libvpx opened a specially crafted file, a remote attacker could possibly use this issue to cause the application to crash, resulting in a denial of service, or the execution of arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.1)

NVT: Ubuntu: Security Advisory (USN-4991-1)

Summary
The remote host is missing an update for the 'libxml2' package(s) announced via the USN-4991-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxml2
Installed version:    libxml2-2.9.1+dfsg1-3ubuntu4.13
Fixed version:      >=libxml2-2.9.1+dfsg1-3ubuntu4.13+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxml2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 20.10, Ubuntu 21.04.

Vulnerability Insight
Yunho Kim discovered that libxml2 incorrectly handled certain error conditions. A remote attacker could exploit this with a crafted XML file to cause a denial of service, or possibly cause libxml2 to expose sensitive information. This issue only affected Ubuntu 14.04 ESM, and Ubuntu 16.04 ESM. (CVE-2017-8872)
Zhipeng Xie discovered that libxml2 incorrectly handled certain XML schemas. A remote attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 14.04 ESM, Ubuntu 16.04 ESM, and Ubuntu 18.04 LTS. (CVE-2019-20388)
It was discovered that libxml2 incorrectly handled invalid UTF-8 input. A remote attacker could possibly exploit this with a crafted XML file to cause libxml2 to crash, resulting in a denial of service. This issue only affected Ubuntu 14.04 ESM, Ubuntu 16.04 ESM, Ubuntu 18.04 LTS, Ubuntu 20.04 LTS and Ubuntu 20.10. (CVE-2020-24977)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that libxml2 incorrectly handled invalid UTF-8 input. A remote attacker could possibly exploit this with a crafted XML file to cause libxml2 to crash, resulting in a denial of service. (CVE-2021-3517)
It was discovered that libxml2 did not properly handle certain crafted XML files. A local attacker could exploit this with a crafted input to cause libxml2 to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2021-3516, CVE-2021-3518)
It was discovered that libxml2 incorrectly handled error states. A remote attacker could exploit this with a crafted XML file to cause libxml2 to crash, resulting in a denial of service. (CVE-2021-3537)
Sebastian Pipping discovered that libxml2 did not properly handle certain crafted XML files. A remote attacker could exploit this with a crafted XML file to cause libxml2 to crash, resulting in a denial of service. This issue only affected Ubuntu 20.04 LTS, Ubuntu 20.10, and Ubuntu 21.04. (CVE-2021-3541)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Critical (CVSS: 9.1)

NVT: Ubuntu: Security Advisory (USN-7694-1)

Summary
The remote host is missing an update for the 'libxml2' package(s) announced via the USN-7694-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxml2
Installed version:    libxml2-2.9.1+dfsg1-3ubuntu4.13
Fixed version:      >=libxml2-2.9.1+dfsg1-3ubuntu4.13+esm8
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxml2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.04.

Vulnerability Insight
Ahmed Lekssays discovered that libxml2 did not properly perform certain mathematical operations, leading to an integer overflow. An attacker could possibly use this issue to cause a crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2025-6021)
Ahmed Lekssays discovered that libxml2 did not properly validate the size of an untrusted input stream. An attacker could possibly use this issue to cause a crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2025-6170)
Nikita Sveshnikov discovered that libxml2 did not properly handle certain XPath expressions, leading to a use-after-free vulnerability. An attacker could potentially exploit this issue to cause a denial of service. (CVE-2025-49794)
Nikita Sveshnikov discovered that libxml2 contained a type confusion vulnerability when parsing specially crafted XML documents. An attacker could potentially exploit this issue to cause a denial of service. (CVE-2025-49796)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7257-1)

Summary

The remote host is missing an update for the 'krb5' package(s) announced via the USN-7257-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libk5crypto3
Installed version:    libk5crypto3-1.12+dfsg-2ubuntu5.4
Fixed version:      >=libk5crypto3-1.12+dfsg-2ubuntu5.4+esm6
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'krb5' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 24.10.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

Goldberg, Miro Haller, Nadia Heninger, Mike Milano, Dan Shumow, Marc Stevens, and Adam Suhl discovered that Kerberos incorrectly authenticated certain responses. An attacker able to intercept communications between a RADIUS client and server could possibly use this issue to forge responses, bypass authentication, and access network devices and services.
This update introduces support for the Message-Authenticator attribute in non-EAP authentication methods for communications between Kerberos and a RADIUS server.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: SSH Brute Force Logins With Default Credentials Reporting

Summary
It was possible to login into the remote SSH server using default credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result
`It was possible to login with the following credentials <User>:<Password>`

. . . continues on next page . . .

. . . continued from previous page . . .

`vagrant:vagrant`

Impact
This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.

Solution:
Solution type: Mitigation
Change the password as soon as possible.

Affected Software/OS
The following products are known to use the default credentials checked by the VT 'SSH Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108013) used for this reporting:
- CVE-2017-16523: MitraStar GPT-2541GNAC (HGU) 1.00(VNJ0)b1 and DSL-100HN-T1 ES_113WJY0b16 devices
- CVE-2017-20214: FLIR Thermal Camera F/FC/PT/D
- CVE-2018-25138: FLIR AX8 Thermal Camera
- CVE-2018-25147: Microhard Systems IPn4G
- CVE-2019-25241: FaceSentry Access Control System
- CVE-2019-25291: INIM Electronics Smartliving SmartLAN/G/SI
- CVE-2020-29583: Zyxel Firewall / AP Controller
- CVE-2020-36915: Adtec Digital SignEdje Digital Signage Player
- CVE-2020-37092: Netis E1+ devices
- CVE-2020-9473: S. Siedle & Soehne SG 150-0 Smart Gateway before 1.2.4
- CVE-2021-27797: Brocade Fabric OS
- CVE-2021-47744: Cypress Solutions CTM-200/CTM-ONE
- CVE-2023-1944: minikube 1.29.0 and probably prior
- CVE-2023-53983: Anevia Flamingo XL/XS
- CVE-2024-22902: Vinchin Backup & Recovery
- CVE-2024-31970: AdTran SRG 834-5 HDC17600021F1 devices (with SmartOS 11.1.1.1) during a window of time when the device is being set up
- CVE-2024-46328: VONETS VAP11G-300 v3.3.23.6.9
- CVE-2025-12592: Legacy Vivotek devices
- CVE-2025-68718: KAYSUS KS-WR1200
- Various additional products like e.g. Ubiquiti EdgeMax / EdgeRouter, Crestron AM-100 and similar for which no CVE was assigned (See 'default_credentials.inc' file on the file system for a full list)
Other products might be affected as well.

Vulnerability Insight
As the VT 'SSH Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108013) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

NVT: ProFTPD 'mod_copy' Unauthenticated Copying Of Files Via SITE CPFR/CPTO Vulnerability (Apr 2015) - Active Check

Summary
ProFTPD is prone to an unauthenticated copying of files vulnerability.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
`The target was found to be vulnerable`

Impact
Under some circumstances this could result in remote code execution.

Solution:
Solution type: VendorFix
Ask the vendor for an update.

Vulnerability Detection Method
Tries to copy /etc/passwd to /tmp/passwd.copy with SITE CPFR/CPTO command.
Details: `ProFTPD 'mod_copy' Unauthenticated Copying Of Files Via SITE CPFR/CPTO Vulnerab.`
`↪..`
OID:1.3.6.1.4.1.25623.1.0.105254

2.1.4 High package

High (CVSS: 8.8)

NVT: Ubuntu: Security Advisory (USN-5828-1)

Summary
. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'krb5' package(s) announced via the USN-5828-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libgssapi-krb5-2
Installed version:    libgssapi-krb5-2-1.12+dfsg-2ubuntu5.4
Fixed version:      >=libgssapi-krb5-2-1.12+dfsg-2ubuntu5.4+esm3
Vulnerable package:   libkdb5-7
Installed version:    libkdb5-7-1.12+dfsg-2ubuntu5.4
Fixed version:      >=libkdb5-7-1.12+dfsg-2ubuntu5.4+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'krb5' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10.

Vulnerability Insight
It was discovered that Kerberos incorrectly handled certain S4U2Self requests. An attacker could possibly use this issue to cause a denial of service. This issue was only addressed in Ubuntu 16.04 ESM and Ubuntu 18.04 LTS. (CVE-2018-20217)
Greg Hudson discovered that Kerberos PAC implementation incorrectly handled certain parsing operations. A remote attacker could use this issue to cause a denial of service, or possibly execute arbitrary code. (CVE-2022-42898)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.8)

NVT: Ubuntu: Security Advisory (USN-5841-1)

Summary

The remote host is missing an update for the 'tiff' package(s) announced via the USN-5841-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libtiff5
Installed version:    libtiff5-4.0.3-7ubuntu0.11
Fixed version:      >=libtiff5-4.0.3-7ubuntu0.11+esm6
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

'tiff' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight

It was discovered that LibTIFF incorrectly handled certain malformed images. If a user or automated system were tricked into opening a specially crafted image, a remote attacker could crash the application, leading to a denial of service, or possibly execute arbitrary code with user privileges. This issue was only fixed in Ubuntu 14.04 ESM. (CVE-2019-14973, CVE-2019-17546, CVE-2020-35523, CVE-2020-35524, CVE-2022-3970)

It was discovered that LibTIFF was incorrectly acessing a data structure when processing data with the tiffcrop tool, which could lead to a heap buffer overflow. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2022-48281)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7604-2)

Summary
The remote host is missing an update for the 'sudo' package(s) announced via the USN-7604-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   sudo
Installed version:    sudo-1.8.9p5-1ubuntu1.4
Fixed version:      >=sudo-1.8.9p5-1ubuntu1.5+esm8
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'sudo' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
USN-7604-1 fixed CVE-2025-32462 in sudo. This update provides the corresponding fixes for Ubuntu 20.04 LTS, Ubuntu 18.04 LTS, Ubuntu 16.04 LTS, and Ubuntu 14.04 LTS.
Original advisory details:

. . . continues on next page . . .

. . . continued from previous page . . .

Rich Mirch discovered that Sudo incorrectly handled the host option. In environments where per-host rules are configured in the sudoers file, a local attacker could use this issue to bypass the host restrictions.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7172-1)

Summary
The remote host is missing an update for the 'libvpx' package(s) announced via the USN-7172-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   libvpx1
Installed version:    libvpx1-1.3.0-2
Fixed version:      >=libvpx1-1.3.0-2ubuntu0.1~esm3
```

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Please install the updated package(s).

Affected Software/OS
'libvpx' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that libvpx did not properly handle certain malformed media files. If an application using libvpx opened a specially crafted file, a remote attacker could cause a denial of service, or possibly execute arbitrary code. Ubuntu 22.04 LTS, Ubuntu 20.04 LTS, Ubuntu 18.04 LTS, and Ubuntu 16.04 LTS were previously addressed in USN-6403-1, USN-6403-2, and USN-6403-3. This update addresses the issue in Ubuntu 14.04 LTS.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.8)

NVT: Ubuntu: Security Advisory (USN-7783-1)

Summary
The remote host is missing an update for the 'tiff' package(s) announced via the USN-7783-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libtiff5
Installed version:    libtiff5-4.0.3-7ubuntu0.11
Fixed version:      >=libtiff5-4.0.3-7ubuntu0.11+esm16
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'tiff' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.04.

Vulnerability Insight
Xudong Cao and Yuqing Zhang discovered that LibTIFF incorrectly handled memory when parsing malformed TIFF images. An attacker could possibly use this issue to cause LibTIFF to crash, resulting in a denial of service. (CVE-2025-8961)
Xudong Cao and Yuqing Zhang discovered that LibTIFF incorrectly handled memory when parsing malformed TIFF image headers. An attacker could possibly use this issue to cause LibTIFF to leak memory, resulting in a denial of service. (CVE-2025-9165)
It was discovered that LibTIFF incorrectly handled memory when parsing malformed TIFF image metadata. An attacker could possibly use this issue to cause a denial of service, obtain sensitive information, or execute arbitrary code. (CVE-2025-9900)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.8)

NVT: Ubuntu: Security Advisory (USN-4298-2)

Summary
The remote host is missing an update for the 'sqlite3' package(s) announced via the USN-4298-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libsqlite3-0
Installed version:    libsqlite3-0-3.8.2-1ubuntu2.2
Fixed version:      >=libsqlite3-0-3.8.2-1ubuntu2.2+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'sqlite3' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4298-1 fixed several vulnerabilities in SQLite. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that SQLite incorrectly handled certain shadow tables. An attacker could use this issue to cause SQLite to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2019-13734, CVE-2019-13750, CVE-2019-13752, CVE-2019-13753)
It was discovered that SQLite incorrectly handled certain corrupt records. An attacker could use this issue to cause SQLite to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2019-13751)
It was discovered that SQLite incorrectly handled errors during parsing. An attacker could use this issue to cause SQLite to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2019-19926)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5575-2)

Summary
The remote host is missing an update for the 'libxslt' package(s) announced via the USN-5575-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxslt1.1
Installed version:    libxslt1.1-1.1.28-2ubuntu0.2
Fixed version:      >=libxslt1.1-1.1.28-2ubuntu0.2+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxslt' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5575-1 fixed vulnerabilities in Libxslt. This update provides the corresponding updates for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
Nicolas Gregoire discovered that Libxslt incorrectly handled certain XML. An attacker could possibly use this issue to expose sensitive information or execute arbitrary code. This issue only affected Ubuntu 18.04 LTS. (CVE-2019-5815)
Alexey Neyman incorrectly handled certain HTML pages. An attacker could possibly use this issue to expose sensitive information or execute arbitrary code. (CVE-2021-30560)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-3655-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3655-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.149.159
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Jann Horn and Ken Johnson discovered that microprocessors utilizing speculative execution of a memory read may allow unauthorized memory reads via a sidechannel attack. This flaw is known as Spectre Variant 4. A local attacker could use this to expose sensitive information, including kernel memory. (CVE-2018-3639)

. . . continues on next page . . .

. . . continued from previous page . . .

Jan H. Schonherr discovered that the Xen subsystem did not properly handle block IO merges correctly in some situations. An attacker in a guest vm could use this to cause a denial of service (host crash) or possibly gain administrative privileges in the host. (CVE-2017-12134)
It was discovered that the Bluetooth HIP Protocol implementation in the Linux kernel did not properly validate HID connection setup information. An attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-13220)
It was discovered that a buffer overread vulnerability existed in the keyring subsystem of the Linux kernel. A local attacker could possibly use this to expose sensitive information (kernel memory). (CVE-2017-13305)
It was discovered that the netlink subsystem in the Linux kernel did not properly restrict observations of netlink messages to the appropriate net namespace. A local attacker could use this to expose sensitive information (kernel netlink traffic). (CVE-2017-17449)
It was discovered that a race condition existed in the i8042 serial device driver implementation in the Linux kernel. A physically proximate attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-18079)
It was discovered that a race condition existed in the Device Mapper component of the Linux kernel. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-18203)
It was discovered that a race condition existed in the OCFS2 file system implementation in the Linux kernel. A local attacker could use this to cause a denial of service (kernel deadlock). (CVE-2017-18204)
It was discovered that an infinite loop could occur in the madvise(2) implementation in the Linux kernel in certain circumstances. A local attacker could use this to cause a denial of service (system hang). (CVE-2017-18208)
Kefeng Wang discovered that a race condition existed in the memory locking implementation in the Linux kernel. A local attacker could use this to cause a denial of service. (CVE-2017-18221)
Silvio Cesare discovered a buffer overwrite existed in the NCPFS implementation in the Linux kernel. A remote attacker controlling a malicious NCPFS server could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-8822)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Vulnerability Detection Result

```
Vulnerable package:   libncurses5
Installed version:    libncurses5-5.9+20140118-1ubuntu1
Fixed version:      >=libncurses5-5.9+20140118-1ubuntu1+esm2
Vulnerable package:   libtinfo5
Installed version:    libtinfo5-5.9+20140118-1ubuntu1
Fixed version:      >=libtinfo5-5.9+20140118-1ubuntu1+esm2
Vulnerable package:   ncurses-bin
Installed version:    ncurses-bin-5.9+20140118-1ubuntu1
Fixed version:      >=ncurses-bin-5.9+20140118-1ubuntu1+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'ncurses' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
Hosein Askari discovered that ncurses was incorrectly performing memory management operations when dealing with long filenames while writing structures into the file system. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2017-16879)
Chung-Yi Lin discovered that ncurses was incorrectly handling access to invalid memory areas when parsing terminfo or termcap entries where the use-name had invalid syntax. An attacker could possibly use this issue to cause a denial of service. (CVE-2018-19211)
It was discovered that ncurses was incorrectly performing bounds checks when processing invalid hashcodes. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. (CVE-2019-17594)
It was discovered that ncurses was incorrectly handling end-of-string characters when processing terminfo and termcap files. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. (CVE-2019-17595)
It was discovered that ncurses was incorrectly handling end-of-string characters when converting between termcap and terminfo formats. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2021-39537)
It was discovered that ncurses was incorrectly performing bounds checks when dealing with corrupt terminfo data while reading a terminfo file. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. (CVE-2022-29458)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5553-1)

Summary
The remote host is missing an update for the 'libjpeg-turbo' package(s) announced via the USN-5553-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libjpeg-turbo8
Installed version:    libjpeg-turbo8-1.3.0-0ubuntu2.1
Fixed version:      >=libjpeg-turbo8-1.3.0-0ubuntu2.1+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libjpeg-turbo' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
It was discovered that libjpeg-turbo was not properly handling EOF characters, which could lead to excessive memory consumption through the execution of a large loop. An attacker could possibly use this issue to cause a denial of service. (CVE-2018-11813)
It was discovered that libjpeg-turbo was not properly performing bounds check operations, which could lead to a heap-based buffer overread. If a user or automated system were tricked into opening a specially crafted file, an attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 14.04 ESM. (CVE-2018-14498)
It was discovered that libjpeg-turbo was not properly limiting the amount of main memory being consumed by the system during decompression or multi-pass compression operations, which could lead to excessive memory consumption. An attacker could possibly use this issue to cause a denial of service. (CVE-2020-14152)
It was discovered that libjpeg-turbo was not properly setting variable sizes when performing certain kinds of encoding operations, which could lead to a stack-based buffer overflow. If a user or automated system were tricked into opening a specially crafted file, an attacker could possibly use this issue to cause a denial of service. (CVE-2020-17541)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Summary
The remote host is missing an update for the 'binutils' package(s) announced via the USN-6381-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   binutils
Installed version:    binutils-2.24-5ubuntu14.2
Fixed version:      >=binutils-2.24-5ubuntu14.2+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'binutils' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that a memory leak existed in certain GNU binutils modules. An attacker could possibly use this issue to cause a denial of service (memory exhaustion). (CVE-2020-19724, CVE-2020-21490)
It was discovered that GNU binutils was not properly performing bounds checks in several functions, which could lead to a buffer overflow. An attacker could possibly use this issue to cause a denial of service, expose sensitive information or execute arbitrary code. (CVE-2020-19726, CVE-2021-46174, CVE-2022-45703)
It was discovered that GNU binutils was not properly initializing heap memory when processing certain print instructions. An attacker could possibly use this issue to expose sensitive information. (CVE-2020-35342)
It was discovered that GNU binutils was not properly handling the logic behind certain memory management related operations, which could lead to a buffer overflow. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2022-44840)
It was discovered that GNU binutils was not properly handling the logic behind certain memory management related operations, which could lead to an invalid memory access. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-47695)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.8)

NVT: Ubuntu: Security Advisory (USN-5892-2)

Summary
The remote host is missing an update for the 'nss' package(s) announced via the USN-5892-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libnss3
Installed version:    libnss3-2:3.28.4-0ubuntu0.14.04.5
Fixed version:      >=libnss3-2:3.28.4-0ubuntu0.14.04.5+esm12
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'nss' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5892-1 fixed a vulnerability in NSS. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
Christian Holler discovered that NSS incorrectly handled certain PKCS 12 certificated bundles. A remote attacker could use this issue to cause NSS to crash, leading to a denial of service, or possibly execute arbitrary code. (CVE-2023-0767)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5892-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2023.5892.2

NVT: Ubuntu: Security Advisory (USN-6099-1)

Summary
The remote host is missing an update for the 'ncurses' package(s) announced via the USN-6099-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libncurses5
Installed version:    libncurses5-5.9+20140118-1ubuntu1
Fixed version:      >=libncurses5-5.9+20140118-1ubuntu1+esm3
Vulnerable package:   libncursesw5
Installed version:    libncursesw5-5.9+20140118-1ubuntu1
Fixed version:      >=libncursesw5-5.9+20140118-1ubuntu1+esm3
Vulnerable package:   libtinfo5
Installed version:    libtinfo5-5.9+20140118-1ubuntu1
Fixed version:      >=libtinfo5-5.9+20140118-1ubuntu1+esm3
Vulnerable package:   ncurses-bin
Installed version:    ncurses-bin-5.9+20140118-1ubuntu1
Fixed version:      >=ncurses-bin-5.9+20140118-1ubuntu1+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'ncurses' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10, Ubuntu 23.04.

Vulnerability Insight
It was discovered that ncurses was incorrectly performing bounds checks when processing invalid hashcodes. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. This issue only affected Ubuntu 18.04 LTS. (CVE-2019-17594)
It was discovered that ncurses was incorrectly handling end-of-string characters when processing terminfo and termcap files. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. This issue only affected Ubuntu 18.04 LTS. (CVE-2019-17595)
It was discovered that ncurses was incorrectly handling end-of-string characters when converting between termcap and terminfo formats. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 18.04 LTS and Ubuntu 20.04 LTS. (CVE-2021-39537)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that ncurses was incorrectly performing bounds checks when dealing with corrupt terminfo data while reading a terminfo file. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. This issue only affected Ubuntu 18.04 LTS, Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2022-29458)
It was discovered that ncurses was parsing environment variables when running with setuid applications and not properly handling the processing of malformed data when doing so. A local attacker could possibly use this issue to cause a denial of service (application crash) or execute arbitrary code. (CVE-2023-29491)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-3822-1)

Summary

The remote host is missing an update for the 'linux' package(s) announced via the USN-3822-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.162.172
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight

Jim Mattson discovered that the KVM implementation in the Linux kernel mismanages the #BP and #OF exceptions. A local attacker in a guest virtual machine could use this to cause a denial of service (guest OS crash). (CVE-2016-9588)

It was discovered that the generic SCSI driver in the Linux kernel did not properly enforce permissions on kernel memory access. A local attacker could use this to expose sensitive information or possibly elevate privileges. (CVE-2017-13168)

Andrey Konovalov discovered that the CDC USB Ethernet driver did not properly validate device descriptors. A physically proximate attacker could use this to cause a denial of service (system crash). (CVE-2017-16649)

It was discovered that an integer overflow existed in the CD-ROM driver of the Linux kernel. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2018-16658)

It was discovered that an integer overflow existed in the HID Bluetooth implementation in the Linux kernel that could lead to a buffer overwrite. An attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-9363)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.2)

NVT: Ubuntu: Security Advisory (USN-3968-2)

Summary
The remote host is missing an update for the 'sudo' package(s) announced via the USN-3968-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   sudo
Installed version:    sudo-1.8.9p5-1ubuntu1.4
Fixed version:      >=sudo-1.8.9p5-1ubuntu1.5+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'sudo' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-3968-1 fixed a vulnerability in Sudo. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that Sudo did not properly parse the contents of /proc/[pid]/stat when attempting to determine its controlling tty. A local attacker in some configurations could possibly use this to overwrite any file on the filesystem, bypassing intended permissions. (CVE-2017-1000368)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.1)

NVT: Ubuntu: Security Advisory (USN-4713-2)

Summary
The remote host is missing an update for the 'linux, linux-gke-5.0, linux-gke-5.3, linux-hwe, linux-raspi2-5.3' package(s) announced via the USN-4713-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.184.193
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux, linux-gke-5.0, linux-gke-5.3, linux-hwe, linux-raspi2-5.3' package(s) on Ubuntu 14.04, Ubuntu 18.04.

Vulnerability Insight
It was discovered that the LIO SCSI target implementation in the Linux kernel performed insufficient identifier checking in certain XCOPY requests. An attacker with access to at least one LUN in a multiple backstore environment could use this to expose sensitive information or modify data.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4713-2)`

High (CVSS: 8.1)

NVT: Ubuntu: Security Advisory (USN-5068-1)

Summary
The remote host is missing an update for the 'libgd2' package(s) announced via the USN-5068-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libgd3
Installed version:    libgd3-2.1.0-3ubuntu0.11
Fixed version:      >=libgd3-2.1.0-3ubuntu0.11+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libgd2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 21.04.

Vulnerability Insight
It was discovered that GD Graphics Library incorrectly handled certain GD and GD2 files. An attacker could possibly use this issue to cause a crash or expose sensitive information. This issue only affected Ubuntu 20.04 LTS, Ubuntu 18.04 LTS, Ubuntu 16.04 ESM, and Ubuntu 14.04 ESM. (CVE-2017-6363)
It was discovered that GD Graphics Library incorrectly handled certain TGA files. An attacker could possibly use this issue to cause a denial of service or expose sensitive information. (CVE-2021-381)
It was discovered that GD Graphics Library incorrectly handled certain files. An attacker could possibly use this issue to cause a crash. (CVE-2021-40145)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.1)

NVT: Ubuntu: Security Advisory (USN-6112-1)

Summary
The remote host is missing an update for the 'perl' package(s) announced via the USN-6112-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   perl
Installed version:    perl-5.18.2-2ubuntu1.7
Fixed version:      >=perl-5.18.2-2ubuntu1.7+esm5
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'perl' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
It was discovered that Perl was not properly verifying TLS certificates when using CPAN together with HTTP::Tiny to download modules over HTTPS. If a remote attacker were able to intercept communications, this flaw could potentially be used to install altered modules.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.1)

NVT: Ubuntu: Security Advisory (USN-4386-1)

Summary

The remote host is missing an update for the 'libjpeg-turbo' package(s) announced via the USN-4386-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libjpeg-turbo8
Installed version:    libjpeg-turbo8-1.3.0-0ubuntu2.1
Fixed version:      >=libjpeg-turbo8-1.3.0-0ubuntu2.1+esm1
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'libjpeg-turbo' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 19.10, Ubuntu 20.04.

Vulnerability Insight

It was discovered that libjpeg-turbo incorrectly handled certain PPM files. An attacker could possibly use this issue to access sensitive information.

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5638-4)

Summary
The remote host is missing an update for the 'expat' package(s) announced via the USN-5638-4 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libexpat1
Installed version:    libexpat1-2.1.0-4ubuntu1.4
Fixed version:      >=libexpat1-2.1.0-4ubuntu1.4+esm7
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'expat' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-5638-1 fixed several vulnerabilities in Expat. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
Rhodri James discovered that Expat incorrectly handled memory when processing certain malformed XML files. An attacker could possibly use this issue to cause a crash or execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.1)

NVT: Ubuntu: Security Advisory (USN-8081-1)

Summary
The remote host is missing an update for the 'libpng' package(s) announced via the USN-8081-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libpng12-0
Installed version:    libpng12-0-1.2.50-1ubuntu2.14.04.3
Fixed version:      >=libpng12-0-1.2.50-1ubuntu2.14.04.3+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libpng' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
It was discovered that libpng did not properly handle memory when processing certain PNG files. An attacker could possibly use this issue to cause libpng to crash, resulting in a denial of service, or disclose sensitive information. (CVE-2025-64505)
Joshua Inscoe discovered that libpng did not properly handle memory when processing certain PNG files. An attacker could possibly use this issue to cause libpng to crash, resulting in a denial of service, disclose sensitive information, or execute arbitrary code. (CVE-2026-25646)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7352-2)

Summary

The remote host is missing an update for the 'freetype' package(s) announced via the USN-7352-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libfreetype6
Installed version:    libfreetype6-2.5.2-1ubuntu2.8
Fixed version:      >=libfreetype6-2.5.2-1ubuntu2.8+esm3
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'freetype' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-7352-1 fixed a vulnerability in FreeType. This update provides the corresponding updates for Ubuntu 16.04 LTS and Ubuntu 18.04 LTS. This update also fixes an additional vulnerability in Ubuntu 14.04 LTS.
Original advisory details:
It was discovered that FreeType incorrectly handled certain memory operations when parsing font subglyph structures. A remote attacker could use this issue to cause FreeType to crash, resulting in a denial of service, or possibly execute arbitrary code. This issue only affected Ubuntu 16.04 LTS and Ubuntu 18.04 LTS. (CVE-2025-27363)
Additional advisory details:
It was discovered that FreeType incorrectly handled certain memory operations during typical execution. An attacker could possibly use this issue to cause FreeType to crash, resulting in a denial of service. This issue only affected Ubuntu 14.04 LTS. (CVE-2022-27406)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 8.1)

NVT: Ubuntu: Security Advisory (USN-3933-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3933-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.168.179
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that an information leak vulnerability existed in the Bluetooth implementation of the Linux kernel. An attacker within Bluetooth range could possibly expose sensitive information (kernel memory). (CVE-2017-1000410)
It was discovered that the USB serial device driver in the Linux kernel did not properly validate baud rate settings when debugging is enabled. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-18360)
Mathias Payer and Hui Peng discovered a use-after-free vulnerability in the Advanced Linux Sound Architecture (ALSA) subsystem. A physically proximate attacker could use this to cause a denial of service (system crash). (CVE-2018-19824)

. . . continues on next page . . .

. . . continued from previous page . . .

Shlomi Oberman, Yuli Shapiro, and Ran Menscher discovered an information leak in the Bluetooth implementation of the Linux kernel. An attacker within Bluetooth range could use this to expose sensitive information (kernel memory). (CVE-2019-3459, CVE-2019-3460)
Jann Horn discovered that the KVM implementation in the Linux kernel contained a use-after-free vulnerability. An attacker in a guest VM with access to /dev/kvm could use this to cause a denial of service (guest VM crash). (CVE-2019-6974)
Felix Wilhelm discovered that an information leak vulnerability existed in the KVM subsystem of the Linux kernel, when nested virtualization is used. A local attacker could use this to expose sensitive information (host system memory to a guest VM). (CVE-2019-7222)
Jann Horn discovered that the mmap implementation in the Linux kernel did not properly check for the mmap minimum address in some situations. A local attacker could use this to assist exploiting a kernel NULL pointer dereference vulnerability. (CVE-2019-9213)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-3933-1)`

High (CVSS: 8.0)

NVT: Ubuntu: Security Advisory (USN-3422-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3422-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.132.141
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that a buffer overflow existed in the Bluetooth stack of the Linux kernel when handling L2CAP configuration responses. A physically proximate attacker could use this to cause a denial of service (system crash). (CVE-2017-1000251)
It was discovered that the asynchronous I/O (aio) subsystem of the Linux kernel did not properly set permissions on aio memory mappings in some situations. An attacker could use this to more easily exploit other vulnerabilities. (CVE-2016-10044)

. . . continues on next page . . .

. . . continued from previous page . . .

Baozeng Ding and Andrey Konovalov discovered a race condition in the L2TPv3 IP Encapsulation implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2016-10200)
Andreas Gruenbacher and Jan Kara discovered that the filesystem implementation in the Linux kernel did not clear the setgid bit during a setxattr call. A local attacker could use this to possibly elevate group privileges. (CVE-2016-7097)
Sergej Schumilo, Ralf Spenneberg, and Hendrik Schwartke discovered that the key management subsystem in the Linux kernel did not properly allocate memory in some situations. A local attacker could use this to cause a denial of service (system crash). (CVE-2016-8650)
Vlad Tsyrklevich discovered an integer overflow vulnerability in the VFIO PCI driver for the Linux kernel. A local attacker with access to a vfio PCI device file could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2016-9083, CVE-2016-9084)
It was discovered that an information leak existed in _ _get_user_asm_ex() in the Linux kernel. A local attacker could use this to expose sensitive information. (CVE-2016-9178)
CAI Qian discovered that the sysctl implementation in the Linux kernel did not properly perform reference counting in some situations. An unprivileged attacker could use this to cause a denial of service (system hang). (CVE-2016-9191)
It was discovered that the keyring implementation in the Linux kernel in some situations did not prevent special internal keyrings from being joined by userspace keyrings. A privileged local attacker could use this to bypass module verification. (CVE-2016-9604)
It was discovered that an integer overflow existed in the trace subsystem of the Linux kernel. A local privileged attacker could use this to cause a denial of service (system crash). (CVE-2016-9754)
Andrey Konovalov discovered that the IPv4 implementation in the Linux kernel did not properly handle invalid IP options in some situations. An attacker could use this to cause a denial of service or possibly execute arbitrary code. (CVE-2017-5970)
Dmitry Vyukov discovered that the Linux kernel did not properly handle TCP packets with the URG flag. A remote attacker could use this to cause a denial of service. (CVE-2017-6214)
It was discovered that a race condition existed in the AF_PACKET ... [Please see the references for more information on the vulnerabilities]

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Mohamed Ghannam discovered that a use-after-free vulnerability existed in the Netlink subsystem (XFRM) in the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-16939)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that the Linux kernel did not properly handle copy-on- write of transparent huge pages. A local attacker could use this to cause a denial of service (application crashes) or possibly gain administrative privileges. (CVE-2017-1000405)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

Details: `Ubuntu: Security Advisory (USN-3510-1)`

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-6413-1)

Summary
The remote host is missing an update for the 'binutils' package(s) announced via the USN-6413-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   binutils
Installed version:    binutils-2.24-5ubuntu14.2
Fixed version:      >=binutils-2.24-5ubuntu14.2+esm5
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'binutils' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
It was discovered that GNU binutils was not properly performing checks when dealing with memory allocation operations, which could lead to excessive memory consumption. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 14.04 LTS. (CVE-2017-17122, CVE-2017-8421)
It was discovered that GNU binutils was not properly performing bounds checks when processing debug sections with objdump, which could lead to an overflow. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 14.04 LTS. (CVE-2018-20671, CVE-2018-6543)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that GNU binutils contained a reachable assertion, which could lead to an intentional assertion failure when processing certain crafted DWARF files. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 18.04 LTS. (CVE-2022-35205)
It was discovered that GNU binutils incorrectly handled memory management operations in several of its functions, which could lead to excessive memory consumption due to memory leaks. An attacker could possibly use these issues to cause a denial of service. (CVE-2022-47007, CVE-2022-47008, CVE-2022-47010, CVE-2022-47011)
It was discovered that GNU binutils was not properly performing bounds checks when dealing with memory allocation operations, which could lead to excessive memory consumption. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-48063)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-5380-1)

Summary
The remote host is missing an update for the 'bash' package(s) announced via the USN-5380-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   bash
Installed version:    bash-4.3-7ubuntu1.7
Fixed version:      >=bash-4.3-7ubuntu1.8+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'bash' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
It was discovered that Bash did not properly drop privileges when the binary had the setuid bit enabled. An attacker could possibly use this issue to escalate privileges.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5380-1)`
OID:1.3.6.1.4.1.25623.1.1.12.2022.5380.1

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-6190-2)

Summary
The remote host is missing an update for the 'accountsservice' package(s) announced via the USN-6190-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   accountsservice
Installed version:    accountsservice-0.6.35-0ubuntu7
Fixed version:      >=accountsservice-0.6.35-0ubuntu7.3+esm3
Vulnerable package:   libaccountsservice0
Installed version:    libaccountsservice0-0.6.35-0ubuntu7
Fixed version:      >=libaccountsservice0-0.6.35-0ubuntu7.3+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'accountsservice' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6190-1 fixed a vulnerability in AccountsService. This update provides the corresponding update for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS and Ubuntu 18.04 LTS.
Original advisory details:
Kevin Backhouse discovered that AccountsService incorrectly handled certain D-Bus messages. A local attacker could use this issue to cause AccountsService to crash, resulting in a denial of service, or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-6190-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2023.6190.2

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-3386-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3386-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.128.137
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Andrey Konovalov discovered a race condition in the UDP Fragmentation Offload (UFO) code in the Linux kernel. A local attacker could use this to cause a denial of service or execute arbitrary code. (CVE-2017-1000112)
Andrey Konovalov discovered a race condition in AF_PACKET socket option handling code in the Linux kernel. A local unprivileged attacker could use this to cause a denial of service or possibly execute arbitrary code. (CVE-2017-1000111)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-6154-1)

Summary

The remote host is missing an update for the 'vim' package(s) announced via the USN-6154-1 advisory.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   vim-tiny
Installed version:    vim-tiny-2:7.4.052-1ubuntu3.1
Fixed version:      >=vim-tiny-2:7.4.052-1ubuntu3.1+esm10
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'vim' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10, Ubuntu 23.04.

Vulnerability Insight
It was discovered that Vim was using uninitialized memory when fuzzy matching, which could lead to invalid memory access. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 22.04 LTS, Ubuntu 22.10 and Ubuntu 23.04. (CVE-2023-2426)
It was discovered that Vim was not properly performing bounds checks when processing register contents, which could lead to a NULL pointer dereference. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2023-2609)
It was discovered that Vim was not properly limiting the length of substitution expression strings, which could lead to excessive memory consumption. An attacker could possibly use this issue to cause a denial of service. (CVE-2023-2610)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-6154-1)`

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-8022-1)

Summary
The remote host is missing an update for the 'expat' package(s) announced via the USN-8022-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libexpat1
Installed version:    libexpat1-2.1.0-4ubuntu1.4
Fixed version:      >=libexpat1-2.1.0-4ubuntu1.4+esm11
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'expat' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 25.10.

Vulnerability Insight
It was discovered that Expat incorrectly handled memory when parsing certain XML files. An attacker could possibly use this issue to cause a denial of service. This issue was only addressed in Ubuntu 25.10. (CVE-2025-59375)
It was discovered that Expat incorrectly handled the initialization of parsers for external entities. An attacker could possibly use this issue to cause a denial of service. (CVE-2026-24515)
It was discovered that Expat incorrectly handled integer calculations when allocating memory for XML tags. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2026-25210)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-8079-1)

Summary
The remote host is missing an update for the 'less' package(s) announced via the USN-8079-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   less
Installed version:    less-458-2
Fixed version:      >=less-458-2ubuntu0.1~esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'less' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that less incorrectly handled certain file names. An attacker could possibly use this issue to cause a denial of service or execute arbitrary commands.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-8079-1)`
OID:1.3.6.1.4.1.25623.1.1.12.2026.8079.1

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-3127-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3127-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.101.109
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the compression handling code in the Advanced Linux Sound Architecture (ALSA) subsystem in the Linux kernel did not properly check for an integer overflow. A local attacker could use this to cause a denial of service (system crash). (CVE-2014-9904)
Kirill A. Shutemov discovered that memory manager in the Linux kernel did not properly handle anonymous pages. A local attacker could use this to cause a denial of service or possibly gain administrative privileges. (CVE-2015-3288)
Vitaly Kuznetsov discovered that the Linux kernel did not properly suppress hugetlbfs support in X86 paravirtualized guests. An attacker in the guest OS could cause a denial of service (guest system crash). (CVE-2016-3961)
Ondrej Kozina discovered that the keyring interface in the Linux kernel contained a buffer overflow when displaying timeout events via the /proc/keys interface. A local attacker could use this to cause a denial of service (system crash). (CVE-2016-7042)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-3127-1)`

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-4336-3)

Summary

The remote host is missing an update for the 'binutils' package(s) announced via the USN-4336-3 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   binutils
Installed version:    binutils-2.24-5ubuntu14.2
Fixed version:      >=binutils-2.24-5ubuntu14.2+esm2
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'binutils' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4336-1 fixed several vulnerabilities in GNU. This update provides the corresponding update for Ubuntu 14.04 LTS.
Original advisory details:
It was discovered that GNU binutils contained a large number of security issues. If a user or automated system were tricked into processing a specially-crafted file, a remote attacker could cause GNU binutils to crash, resulting in a denial of service, or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4336-3)`

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-6460-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-6460-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
`Vulnerable package:  linux-image-generic`

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.194.204
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the IPv6 implementation in the Linux kernel contained a high rate of hash collisions in connection lookup table. A remote attacker could use this to cause a denial of service (excessive CPU consumption). (CVE-2023-1206)
It was discovered that the Broadcom FullMAC USB WiFi driver in the Linux kernel did not properly perform data buffer size validation in some situations. A physically proximate attacker could use this to craft a malicious USB device that when inserted, could cause a denial of service (system crash) or possibly expose sensitive information. (CVE-2023-1380)
Gwangun Jung discovered that the Quick Fair Queueing scheduler implementation in the Linux kernel contained an out-of-bounds write vulnerability. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2023-31436)
Tanguy Dubroca discovered that the netfilter subsystem in the Linux kernel did not properly handle certain pointer data type, leading to an out-of- bounds write vulnerability. A privileged attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2023-35001)
Kyle Zeng discovered that the networking stack implementation in the Linux kernel did not properly validate skb object size in certain conditions. An attacker could use this cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2023-42752)
Kyle Zeng discovered that the IPv4 Resource Reservation Protocol (RSVP) classifier implementation in the Linux kernel contained an out-of-bounds read vulnerability. A local attacker could use this to cause a denial of service (system crash). Please note that kernel packet classifier support for RSVP has been removed to resolve this vulnerability. (CVE-2023-42755)
Budimir Markovic discovered that the qdisc implementation in the Linux kernel did not properly validate inner classes, leading to a use-after-free vulnerability. A local user could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2023-4623)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-3698-1)

Summary

The remote host is missing an update for the 'linux' package(s) announced via the USN-3698-1 advisory.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.153.163
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the nested KVM implementation in the Linux kernel in some situations did not properly prevent second level guests from reading and writing the hardware CR8 register. A local attacker in a guest could use this to cause a denial of service (system crash). (CVE-2017-12154)
Fan Wu, Haoran Qiu, and Shixiong Zhao discovered that the associative array implementation in the Linux kernel sometimes did not properly handle adding a new entry. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-12193)
It was discovered that a race condition existed in the ALSA subsystem of the Linux kernel when creating and deleting a port via ioctl(). A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-15265)
It was discovered that a null pointer dereference vulnerability existed in the DCCP protocol implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system crash). (CVE-2018-1130)
Julian Stecklina and Thomas Prescher discovered that FPU register states (such as MMX, SSE, and AVX registers) which are lazily restored are potentially vulnerable to a side channel attack. A local attacker could use this to expose sensitive information. (CVE-2018-3665)
Wang Qize discovered that an information disclosure vulnerability existed in the SMBus driver for ACPI Embedded Controllers in the Linux kernel. A local attacker could use this to expose sensitive information (kernel pointer addresses). (CVE-2018-5750)
It was discovered that the SCTP Protocol implementation in the Linux kernel did not properly validate userspace provided payload lengths in some situations. A local attacker could use this to cause a denial of service (system crash). (CVE-2018-5803)
It was discovered that an integer overflow error existed in the futex implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system crash). (CVE-2018-6927)
It was discovered that an information leak vulnerability existed in the floppy driver in the Linux kernel. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2018-7755)
It was discovered that a memory leak existed in the SAS driver subsystem of the Linux kernel. A local attacker could use this to cause a denial of service (memory exhaustion). (CVE-2018-7757)

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-7707-1)

Summary

The remote host is missing an update for the 'tiff' package(s) announced via the USN-7707-1 advisory.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libtiff5
Installed version:    libtiff5-4.0.3-7ubuntu0.11
Fixed version:      >=libtiff5-4.0.3-7ubuntu0.11+esm15
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'tiff' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.04.

Vulnerability Insight
It was discovered that LibTIFF incorrectly handled certain memory operations when using tiffmedian tool. An attacker could trick a user into processing a specially crafted tiff image file and potentially use this issue to cause a denial of service. (CVE-2025-8176)
It was discovered that LibTIFF did not properly perform bounds checking in certain operations when using thumbnail tool. An attacker could trick a user into processing a specially crafted tiff image file and potentially use this issue to cause a denial of service. This issue only affected Ubuntu 14.04 LTS and Ubuntu 16.04 LTS. (CVE-2025-8177)
It was discovered that LibTIFF incorrectly handled certain memory operations when using tiff2ps tool. An attacker could trick a user into processing a specially crafted tiff image file and potentially use this issue to cause a denial of service. (CVE-2025-8534)
It was discovered that LibTIFF did not properly perform bounds checking in certain operations when using tiffcrop tool. An attacker could trick a user into processing a specially crafted tiff image file and potentially use this issue to cause a denial of service. (CVE-2025-8851)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-4705-2)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'sudo' package(s) announced via the USN-4705-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   sudo
Installed version:    sudo-1.8.9p5-1ubuntu1.4
Fixed version:      >=sudo-1.8.9p5-1ubuntu1.5+esm6
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'sudo' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4705-1 fixed a vulnerability in Sudo. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that Sudo incorrectly handled memory when parsing command lines. A local attacker could possibly use this issue to obtain unintended access to the administrator account. (CVE-2021-3156)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4705-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2021.4705.2
Version used: `2024-08-07T11:21:35Z`

NVT: Ubuntu: Security Advisory (USN-3968-3)

Summary
The remote host is missing an update for the 'sudo' package(s) announced via the USN-3968-3 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   sudo
Installed version:    sudo-1.8.9p5-1ubuntu1.4
Fixed version:      >=sudo-1.8.9p5-1ubuntu1.5+esm5
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'sudo' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-3968-1 fixed several vulnerabilities in Sudo. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
Florian Weimer discovered that Sudo incorrectly handled the noexec restriction when used with certain applications. A local attacker could possibly use this issue to bypass configured restrictions and execute arbitrary commands. (CVE-2016-7076, CVE-2016-7032)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-3968-3)`
OID:1.3.6.1.4.1.25623.1.1.12.2020.3968.3

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-8147-1)

Summary
The remote host is missing an update for the 'libarchive' package(s) announced via the USN-8147-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libarchive13
Installed version:    libarchive13-3.1.2-7ubuntu2.8
Fixed version:      >=libarchive13-3.1.2-7ubuntu2.8+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libarchive' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.10.

Vulnerability Insight
It was discovered that libarchive incorrectly handled certain archive files. An attacker could possibly use this issue to access sensitive information. This issue only affected Ubuntu 14.04 LTS. (CVE-2019-19221)
It was discovered that libarchive incorrectly handled certain RAR archive files. If a user or automated system were tricked into processing a specially crafted RAR archive, an attacker could possibly use this issue to cause libarchive to crash, resulting in a denial of service, or execute arbitrary code. This issue only affected Ubuntu 14.04 LTS, Ubuntu 16.04 LTS and Ubuntu 18.04 LTS. (CVE-2024-20696)
It was discovered that libarchive incorrectly handled certain RAR archive files. An attacker could possibly use this issue to execute arbitrary code or cause a denial of service. This issue only affected Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS and Ubuntu 20.04 LTS. (CVE-2025-5914)
It was discovered that libarchive incorrectly handled certain WARC archive files. If a user or automated system were tricked into processing a specially crafted WARC archive, an attacker could possibly use this issue to cause libarchive to crash, resulting in a denial of service. This issue only affected Ubuntu 18.04 LTS and Ubuntu 20.04 LTS. (CVE-2025-5916)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that libarchive incorrectly handled certain file names when handling prefixes and suffixes. An attacker could possibly use this issue to cause libarchive to crash, resulting in a denial of service. This issue only affected Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS and Ubuntu 20.04 LTS. (CVE-2025-5917)
It was discovered that libarchive could read past the end of file streams when processing input to bsdtar. An attacker could possibly use this issue to cause memory corruption or a denial of service. (CVE-2025-5918)
It was discovered that libarchive incorrectly handled certain TAR archive files. If a user or automated system were tricked into processing a specially crafted TAR archive, an attacker could possibly use this issue to cause libarchive to crash, resulting in a denial of service, or execute arbitrary code. This issue only affected Ubuntu 14.04 LTS, Ubuntu 16.04 LTS and Ubuntu 18.04 LTS. (CVE-2025-25724)
HyungJung Joo discovered that libarchive did not properly limit memory allocation when processing substitution rules in bsdtar. An attacker could possibly use this issue to cause excessive memory consumption, leading to a denial of service. (CVE-2025-60753)
Elhanan Haenel discovered that libarchive could enter an infinite loop when processing crafted RAR5 archives. An attacker could possibly use this issue to cause excessive CPU consumption, leading to a denial of service. This issue only affected Ubuntu 20.04 LTS, Ubuntu 22.04 LTS, Ubuntu 24.04 LTS and Ubuntu 25.10. (CVE-2026-4111)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-3470-1)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'linux' package(s) announced via the USN-3470-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.135.144
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Qian Zhang discovered a heap-based buffer overflow in the tipc_msg_build() function in the Linux kernel. A local attacker could use to cause a denial of service (system crash) or possibly execute arbitrary code with administrative privileges. (CVE-2016-8632)
Dmitry Vyukov discovered that a race condition existed in the timerfd subsystem of the Linux kernel when handling might_cancel queuing. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-10661)
It was discovered that the Flash-Friendly File System (f2fs) implementation in the Linux kernel did not properly validate superblock metadata. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-10662, CVE-2017-10663)
Anthony Perard discovered that the Xen virtual block driver did not properly initialize some data structures before passing them to user space. A local attacker in a guest VM could use this to expose sensitive information from the host OS or other guest VMs. (CVE-2017-10911)
It was discovered that a use-after-free vulnerability existed in the POSIX message queue implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-11176)
Dave Chinner discovered that the XFS filesystem did not enforce that the realtime inode flag was settable only on filesystems on a realtime device. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-14340)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-7787-1)

Summary
The remote host is missing an update for the 'libxslt' package(s) announced via the USN-7787-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxslt1.1
Installed version:    libxslt1.1-1.1.28-2ubuntu0.2
Fixed version:      >=libxslt1.1-1.1.28-2ubuntu0.2+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxslt' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
Ivan Fratric discovered that Libxslt did not correctly handle certain memory operations. An attacker could possibly use this issue to execute arbitrary code or cause a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-3406-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3406-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.129.138
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

. . . continued from previous page . . .

Vulnerability Insight

It was discovered that an out of bounds read vulnerability existed in the associative array implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or expose sensitive information. (CVE-2016-7914)

It was discovered that a NULL pointer dereference existed in the Direct Rendering Manager (DRM) driver for VMWare devices in the Linux kernel. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-7261)

It was discovered that the USB Cypress HID drivers for the Linux kernel did not properly validate reported information from the device. An attacker with physical access could use this to expose sensitive information (kernel memory). (CVE-2017-7273)

A reference count bug was discovered in the Linux kernel ipx protocol stack. A local attacker could exploit this flaw to cause a denial of service or possibly other unspecified problems. (CVE-2017-7487)

Huang Weller discovered that the ext4 filesystem implementation in the Linux kernel mishandled a needs-flushing-before-commit list. A local attacker could use this to expose sensitive information. (CVE-2017-7495)

It was discovered that an information leak existed in the set_mempolicy and mbind compat syscalls in the Linux kernel. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2017-7616)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

USN 3335-1 fixed a vulnerability in the Linux kernel. However, that fix introduced regressions for some Java applications. This update addresses the issue. We apologize for the inconvenience.
It was discovered that a use-after-free vulnerability in the core voltage regulator driver of the Linux kernel. A local attacker could use this to cause a denial of service or possibly execute arbitrary code. (CVE-2014-9940)
It was discovered that a buffer overflow existed in the trace subsystem in the Linux kernel. A privileged local attacker could use this to execute arbitrary code. (CVE-2017-0605)
Roee Hay discovered that the parallel port printer driver in the Linux kernel did not properly bounds check passed arguments. A local attacker with write access to the kernel command line arguments could use this to execute arbitrary code. (CVE-2017-1000363)
Li Qiang discovered that an integer overflow vulnerability existed in the Direct Rendering Manager (DRM) driver for VMWare devices in the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-7294)
It was discovered that a double-free vulnerability existed in the IPv4 stack of the Linux kernel. An attacker could use this to cause a denial of service (system crash). (CVE-2017-8890)
Andrey Konovalov discovered an IPv6 out-of-bounds read error in the Linux kernel's IPv6 stack. A local attacker could cause a denial of service or potentially other unspecified problems. (CVE-2017-9074)
Andrey Konovalov discovered a flaw in the handling of inheritance in the Linux kernel's IPv6 stack. A local user could exploit this issue to cause a denial of service or possibly other unspecified problems. (CVE-2017-9075)
It was discovered that dccp v6 in the Linux kernel mishandled inheritance. A local attacker could exploit this issue to cause a denial of service or potentially other unspecified problems. (CVE-2017-9076)
It was discovered that the transmission control protocol (tcp) v6 in the Linux kernel mishandled inheritance. A local attacker could exploit this issue to cause a denial of service or potentially other unspecified problems. (CVE-2017-9077)
It was discovered that the IPv6 stack in the Linux kernel was performing its over write consistency check after the data was actually overwritten. A local attacker could exploit this flaw to cause a denial of service (system crash). (CVE-2017-9242)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7911-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-7911-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.209.219
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

Several security issues were discovered in the Linux kernel. An attacker could possibly use these to compromise the system. This update corrects flaws in the following subsystems: - SCSI subsystem, - JFS file system, (CVE-2023-52975, CVE-2024-56596)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6165-2)

Summary
The remote host is missing an update for the 'glib2.0' package(s) announced via the USN-6165-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   libglib2.0-0
Installed version:    libglib2.0-0-2.40.2-0ubuntu1.1
Fixed version:      >=libglib2.0-0-2.40.2-0ubuntu1.1+esm6
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'glib2.0' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6165-1 fixed vulnerabilities in GLib. This update provides the corresponding updates for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS and Ubuntu 18.04 LTS.
Original advisory details:
It was discovered that GLib incorrectly handled non-normal GVariants. An attacker could use this issue to cause GLib to crash, resulting in a denial of service, or perform other unknown attacks.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-3149-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3149-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.105.113
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Philip Pettersson discovered a race condition in the af_packet implementation in the Linux kernel. A local unprivileged attacker could use this to cause a denial of service (system crash) or run arbitrary code with administrative privileges.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7896-1)

Summary
The remote host is missing an update for the 'libxml2' package(s) announced via the USN-7896-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxml2
Installed version:    libxml2-2.9.1+dfsg1-3ubuntu4.13
Fixed version:      >=libxml2-2.9.1+dfsg1-3ubuntu4.13+esm10
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxml2' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the libxml2 Python bindings incorrectly handled certain return values. An attacker could possibly use this issue to cause libxml2 to crash, resulting in a denial of service. (CVE-2025-32414)
It was discovered that libxml2 incorrectly handled certain memory operations. A remote attacker could possibly use this issue to cause libxml2 to crash, resulting in a denial of service. (CVE-2025-32415)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that libxslt, used by libxml2, incorrectly handled certain attributes. An attacker could use this issue to cause a crash, resulting in a denial of service, or possibly execute arbitrary code. This update adds a fix to libxml2 to mitigate the libxslt vulnerability. (CVE-2025-7425)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-3849-1)

Summary

The remote host is missing an update for the 'linux' package(s) announced via the USN-3849-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:    linux-image-generic
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.164.174
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that a NULL pointer dereference existed in the keyring subsystem of the Linux kernel. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-2647)
It was discovered that a race condition existed in the raw MIDI driver for the Linux kernel, leading to a double free vulnerability. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-10902)
It was discovered that an integer overrun vulnerability existed in the POSIX timers implementation in the Linux kernel. A local attacker could use this to cause a denial of service. (CVE-2018-12896)
Noam Rathaus discovered that a use-after-free vulnerability existed in the Infiniband implementation in the Linux kernel. An attacker could use this to cause a denial of service (system crash). (CVE-2018-14734)
It was discovered that the YUREX USB device driver for the Linux kernel did not properly restrict user space reads or writes. A physically proximate attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-16276)
Tetsuo Handa discovered a logic error in the TTY subsystem of the Linux kernel. A local attacker with access to pseudo terminal devices could use this to cause a denial of service. (CVE-2018-18386)
Kanda Motohiro discovered that writing extended attributes to an XFS file system in the Linux kernel in certain situations could cause an error condition to occur. A local attacker could use this to cause a denial of service. (CVE-2018-18690)
It was discovered that an integer overflow vulnerability existed in the CDROM driver of the Linux kernel. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2018-18710)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-5252-2)

Summary
The remote host is missing an update for the 'policykit-1' package(s) announced via the USN-5252-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   policykit-1
Installed version:    policykit-1-0.105-4ubuntu3.14.04.6
Fixed version:      >=policykit-1-0.105-4ubuntu3.14.04.6+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'policykit-1' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5252-1 fixed a vulnerability in policykit-1. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
It was discovered that the PolicyKit pkexec tool incorrectly handled command-line arguments. A local attacker could use this issue to escalate privileges to an administrator.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5252-2)`

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-4058-2)

Summary

The remote host is missing an update for the 'bash' package(s) announced via the USN-4058-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   bash
Installed version:    bash-4.3-7ubuntu1.7
Fixed version:      >=bash-4.3-7ubuntu1.8+esm1
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'bash' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

USN-4058-1 fixed a vulnerability in bash. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that Bash incorrectly handled the restricted shell. An attacker could possibly use this issue to escape restrictions and execute any command.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4058-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2019.4058.2

Vulnerability Insight

Jordy Zomer and Alexandra Sandulescu discovered that syscalls invoking the do_prlimit() function in the Linux kernel did not properly handle speculative execution barriers. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2023-0458)

It was discovered that a use-after-free vulnerability existed in the IEEE 1394 (Firewire) implementation in the Linux kernel. A privileged attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2023-3159)

It was discovered that the virtual terminal driver in the Linux kernel contained a use-after-free vulnerability. A local attacker could use this to cause a denial of service (system crash) or possibly expose sensitive information (kernel memory). (CVE-2023-3567)

It was discovered that the Quick Fair Queueing network scheduler implementation in the Linux kernel contained an out-of-bounds write vulnerability. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2023-3611)

It was discovered that the network packet classifier with netfilter/firewall marks implementation in the Linux kernel did not properly handle reference counting, leading to a use-after-free vulnerability. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2023-3776)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-3775-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3775-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.160.170
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the paravirtualization implementation in the Linux kernel did not properly handle some indirect calls, reducing the effectiveness of Spectre v2 mitigations for paravirtual guests. A local attacker could use this to expose sensitive information. (CVE-2018-15594)
It was discovered that microprocessors utilizing speculative execution and prediction of return addresses via Return Stack Buffer (RSB) may allow unauthorized memory reads via sidechannel attacks. An attacker could use this to expose sensitive information. (CVE-2018-15572)
It was discovered that an integer overflow vulnerability existed in the Linux kernel when loading an executable to run. A local attacker could use this to gain administrative privileges. (CVE-2018-14634)
It was discovered that a stack-based buffer overflow existed in the iSCSI target implementation of the Linux kernel. A remote attacker could use this to cause a denial of service (system crash). (CVE-2018-14633)
It was discovered that a memory leak existed in the IRDA subsystem of the Linux kernel. A local attacker could use this to cause a denial of service (kernel memory exhaustion). (CVE-2018-6554)
It was discovered that a use-after-free vulnerability existed in the IRDA implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-6555)

NVT: Ubuntu: Security Advisory (USN-6101-1)

Summary
The remote host is missing an update for the 'binutils' package(s) announced via the USN-6101-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   binutils
Installed version:    binutils-2.24-5ubuntu14.2
Fixed version:      >=binutils-2.24-5ubuntu14.2+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'binutils' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10, Ubuntu 23.04.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight

It was discovered that GNU binutils incorrectly handled certain DWARF files. An attacker could possibly use this issue to cause a crash or execute arbitrary code. This issue only affected Ubuntu 22.10. (CVE-2023-1579)

It was discovered that GNU binutils did not properly verify the version definitions in zer0-lengthverdef table. An attacker could possibly use this issue to cause a crash or execute arbitrary code. This issue only affected Ubuntu 22.04 LTS, Ubuntu 22.10 and Ubuntu 23.04. (CVE-2023-1972)

It was discovered that GNU binutils did not properly validate the size of length parameter in vms-alpha. An attacker could possibly use this issue to cause a crash or access sensitive information. This issue only affected Ubuntu 18.04 LTS, Ubuntu 20.04 LTS, Ubuntu 22.04 LTS and Ubuntu 22.10. (CVE-2023-25584)

It was discovered that GNU binutils did not properly initialized the file_table field of struct module and the_bfd field of asymbol. An attacker could possibly use this issue to cause a crash. This issue only affected Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS, Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2023-25585, CVE-2023-25588)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4672-1)

Summary
The remote host is missing an update for the 'unzip' package(s) announced via the USN-4672-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   unzip
Installed version:    unzip-6.0-9ubuntu1.5
Fixed version:      >=unzip-6.0-9ubuntu1.6
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'unzip' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
Rene Freingruber discovered that unzip incorrectly handled certain specially crafted password protected ZIP archives. If a user or automated system using unzip were tricked into opening a specially crafted zip file, an attacker could exploit this to cause a crash, resulting in a denial of service. (CVE-2018-1000035)
Antonio Carista discovered that unzip incorrectly handled certain specially crafted ZIP archives. If a user or automated system using unzip were tricked into opening a specially crafted zip file, an attacker could exploit this to cause a crash, resulting in a denial of service. This issue only affected Ubuntu 12.04 ESM and Ubuntu 14.04 ESM. (CVE-2018-18384)
It was discovered that unzip incorrectly handled certain specially crafted ZIP archives. If a user or automated system using unzip were tricked into opening a specially crafted zip file, an attacker could exploit this to cause resource consumption, resulting in a denial of service. (CVE-2019-13232)
Martin Carpenter discovered that unzip incorrectly handled certain specially crafted ZIP archives. If a user or automated system using unzip were tricked into opening a specially crafted zip file, an attacker could exploit this to cause a crash, resulting in a denial of service. This issue only affected Ubuntu 12.04 ESM, Ubuntu 14.04 ESM and Ubuntu 16.04 LTS. (CVE-2014-9913)
Alexis Vanden Eijnde discovered that unzip incorrectly handled certain specially crafted ZIP archives. If a user or automated system using unzip were tricked into opening a specially crafted zip file, an attacker could exploit this to cause a crash, resulting in a denial of service. This issue only affected Ubuntu 12.04 ESM, Ubuntu 14.04 ESM and Ubuntu 16.04 LTS. (CVE-2016-9844)

Summary
The remote host is missing an update for the 'libx11' package(s) announced via the USN-6407-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libx11-6
Installed version:    libx11-6-2:1.6.2-1ubuntu2.1
Fixed version:      >=libx11-6-2:1.6.2-1ubuntu2.1+esm5
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libx11' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6407-1 fixed several vulnerabilities in libx11. This update provides the corresponding update for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS and Ubuntu 18.04 LTS.
Original advisory details:
Gregory James Duck discovered that libx11 incorrectly handled certain keyboard symbols. If a user were tricked into connecting to a malicious X server, a remote attacker could use this issue to cause libx11 to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2023-43785)
Yair Mizrahi discovered that libx11 incorrectly handled certain malformed XPM image files. If a user were tricked into opening a specially crafted XPM image file, a remote attacker could possibly use this issue to consume memory, leading to a denial of service. (CVE-2023-43786)

```
Vulnerable package:   libsndfile1
Installed version:    libsndfile1-1.0.25-7ubuntu2.2
Fixed version:      >=libsndfile1-1.0.25-7ubuntu2.2+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'libsndfile' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 23.04, Ubuntu 23.10.

Vulnerability Insight
It was discovered that libsndfile contained multiple arithmetic overflows. If a user or automated system were tricked into processing a specially crafted audio file, an attacker could possibly use this issue to cause a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-6471-1)`

'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight

Reima Ishii discovered that the nested KVM implementation for Intel x86 processors in the Linux kernel did not properly validate control registers in certain situations. An attacker in a guest VM could use this to cause a denial of service (guest crash). (CVE-2023-30456)

It was discovered that the Quick Fair Queueing scheduler implementation in the Linux kernel did not properly handle network packets in certain conditions, leading to a use after free vulnerability. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2023-4921)

It was discovered that a race condition existed in the SCSI Emulex LightPulse Fibre Channel driver in the Linux kernel when unregistering FCF and re-scanning an HBA FCF table, leading to a null pointer dereference vulnerability. A local attacker could use this to cause a denial of service (system crash). (CVE-2024-24855)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-4360-4)

Summary
The remote host is missing an update for the 'json-c' package(s) announced via the USN-4360-4 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libjson-c2
Installed version:    libjson-c2-0.11-3ubuntu1.2
Fixed version:      >=libjson-c2-0.11-3ubuntu1.2+esm3
Vulnerable package:   libjson0
Installed version:    libjson0-0.11-3ubuntu1.2
Fixed version:      >=libjson0-0.11-3ubuntu1.2+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'json-c' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 19.10, Ubuntu 20.04.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

USN-4360-1 fixed a vulnerability in json-c. The security fix introduced a memory leak that was reverted in USN-4360-2 and USN-4360-3. This update provides the correct fix update for CVE-2020-12762.
Original advisory details:
It was discovered that json-c incorrectly handled certain JSON files. An attacker could possibly use this issue to execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4360-4)`

. . . continued from previous page . . .

'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight

Peter Pi discovered that the colormap handling for frame buffer devices in the Linux kernel contained an integer overflow. A local attacker could use this to disclose sensitive information (kernel memory). (CVE-2016-8405)

It was discovered that the Linux kernel did not properly restrict RLIMIT_STACK size. A local attacker could use this in conjunction with another vulnerability to possibly execute arbitrary code. (CVE-2017-1000365)

It was discovered that SELinux in the Linux kernel did not properly handle empty writes to /proc/pid/attr. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-2618)

Shi Lei discovered that the RxRPC Kerberos 5 ticket handling code in the Linux kernel did not properly verify metadata. A remote attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-7482)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-3880-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3880-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.165.175
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the CIFS client implementation in the Linux kernel did not properly handle setup negotiation during session recovery, leading to a NULL pointer exception. An attacker could use this to create a malicious CIFS server that caused a denial of service (client system crash). (CVE-2018-1066)
Jann Horn discovered that the procfs file system implementation in the Linux kernel did not properly restrict the ability to inspect the kernel stack of an arbitrary task. A local attacker could use this to expose sensitive information. (CVE-2018-17972)
Jann Horn discovered that the mremap() system call in the Linux kernel did not properly flush the TLB when completing, potentially leaving access to a physical page after it has been released to the page allocator. A local attacker could use this to cause a denial of service (system crash), expose sensitive information, or possibly execute arbitrary code. (CVE-2018-18281)
It was discovered that the socket implementation in the Linux kernel contained a type confusion error that could lead to memory corruption. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-9568)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-5464-1)

Summary

The remote host is missing an update for the 'e2fsprogs' package(s) announced via the USN-5464-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   e2fsprogs
Installed version:    e2fsprogs-1.42.9-3ubuntu1.2
Fixed version:      >=e2fsprogs-1.42.9-3ubuntu1.3+esm3
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'e2fsprogs' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 21.10, Ubuntu 22.04.

Vulnerability Insight
Nils Bars discovered that e2fsprogs incorrectly handled certain file systems. A local attacker could use this issue with a crafted file system image to possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Installed version:    python3.4-minimal-3.4.3-1ubuntu1~14.04.7
Fixed version:      >=python3.4-minimal-3.4.3-1ubuntu1~14.04.7+esm14
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7, python3.4, python3.6, python3.7, python3.8, python3.9, python3.11, python3.13' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.10.

Vulnerability Insight
It was discovered that Python incorrectly handled parsing bracketed hosts. A remote attacker could possibly use this issue to perform a Server-Side Request Forgery (SSRF) attack. This issue only affected python 2.7 and python3.4 on Ubuntu 14.04 LTS, python2.7 on Ubuntu 16.04 LTS, python2.7, python3.6, python3.7, and python3.8 on Ubuntu 18.04 LTS, python2.7 and python3.9 on Ubuntu 20.04 LTS, and python2.7 and python3.11 on Ubuntu 22.04 LTS. (CVE-2024-11168)
It was discovered that Python allowed excessive backtracking while parsing certain tarfile headers. A remote attacker could possibly use this issue to cause Python to consume excessive resources, leading to a denial of service. This issue only affected python3.4 on Ubuntu 14.04 LTS, python3.6, python3.7, and python3.8 on Ubuntu 18.04 LTS, python3.9 on Ubuntu 20.04 LTS, and python3.11 on Ubuntu 22.04 LTS. (CVE-2024-6232)
It was discovered that Python incorrectly handled quoted path names when using the venv module. A local attacker able to control virtual environments could possibly use this issue to execute arbitrary code when the virtual environment is activated. This issue only affected python3.4 on Ubuntu 14.04 LTS, python3.6, python3.7, and python3.8 on Ubuntu 18.04 LTS, python3.9 on Ubuntu 20.04 LTS, python3.11 on Ubuntu 22.04 LTS, and python3.13 on Ubuntu 24.10. (CVE-2024-9287)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-6408-2)

Summary

The remote host is missing an update for the 'libxpm' package(s) announced via the USN-6408-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Vulnerable package:   libxpm4
Installed version:    libxpm4-1:3.5.10-1ubuntu0.1
Fixed version:      >=libxpm4-1:3.5.10-1ubuntu0.1+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxpm' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6408-1 fixed several vulnerabilities in libXpm. This update provides the corresponding update for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS and Ubuntu 18.04 LTS.
Original advisory details:
Yair Mizrahi discovered that libXpm incorrectly handled certain malformed XPM image files. If a user were tricked into opening a specially crafted XPM image file, a remote attacker could possibly use this issue to consume memory, leading to a denial of service. (CVE-2023-43786)
Yair Mizrahi discovered that libXpm incorrectly handled certain malformed XPM image files. If a user were tricked into opening a specially crafted XPM image file, a remote attacker could use this issue to cause libXpm to crash, leading to a denial of service, or possibly execute arbitrary code. (CVE-2023-43787)
Alan Coopersmith discovered that libXpm incorrectly handled certain malformed XPM image files. If a user were tricked into opening a specially crafted XPM image file, a remote attacker could possibly use this issue to cause libXpm to crash, leading to a denial of service. (CVE-2023-43788, CVE-2023-43789)

Fixed version:      >=linux-image-generic-3.13.0.147.157
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux, linux-aws, linux-azure, linux-euclid, linux-gcp, linux-hwe, linux-kvm, linux-lts-xenial, linux-oem, linux-raspi2, linux-snapdragon' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 17.10.

Vulnerability Insight
Nick Peterson discovered that the Linux kernel did not properly handle debug exceptions following a MOV/POP to SS instruction. A local attacker could use this to cause a denial of service (system crash). This issue only affected the amd64 architecture. (CVE-2018-8897)
Andy Lutomirski discovered that the KVM subsystem of the Linux kernel did not properly emulate the ICEBP instruction following a MOV/POP to SS instruction. A local attacker in a KVM virtual machine could use this to cause a denial of service (guest VM crash) or possibly escalate privileges inside of the virtual machine. This issue only affected the i386 and amd64 architectures. (CVE-2018-1087)
Andy Lutomirski discovered that the Linux kernel did not properly perform error handling on virtualized debug registers. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-1000199)

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-4402-1)

Summary

The remote host is missing an update for the 'curl' package(s) announced via the USN-4402-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm4
Vulnerable package:   libcurl3
Installed version:    libcurl3-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm4
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm4
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

'curl' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 19.10, Ubuntu 20.04.

Vulnerability Insight

Marek Szlagor, Gregory Jefferis and Jeroen Ooms discovered that curl incorrectly handled certain credentials. An attacker could possibly use this issue to expose sensitive information. This issue only affected Ubuntu 19.10 and Ubuntu 20.04 LTS. (CVE-2020-8169)

It was discovered that curl incorrectly handled certain parameters. An attacker could possibly use this issue to overwrite a local file. (CVE-2020-8177)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-4135-2)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'linux, linux-aws, linux-azure, linux-lts-trusty, linux-lts-xenial' package(s) announced via the USN-4135-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.173.184
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux, linux-aws, linux-azure, linux-lts-trusty, linux-lts-xenial' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
Peter Pi discovered a buffer overflow in the virtio network backend (vhost_net) implementation in the Linux kernel. An attacker in a guest may be able to use this to cause a denial of service (host OS crash) or possibly execute arbitrary code in the host OS. (CVE-2019-14835)
It was discovered that the Linux kernel on PowerPC architectures did not properly handle Facility Unavailable exceptions in some situations. A local attacker could use this to expose sensitive information. (CVE-2019-15030)
It was discovered that the Linux kernel on PowerPC architectures did not properly handle exceptions on interrupts in some situations. A local attacker could use this to expose sensitive information. (CVE-2019-15031)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4135-2)`

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-5014-1)

Summary

The remote host is missing an update for the 'linux, linux-aws, linux-azure, linux-gcp, linux-gke-5.3, linux-hwe, linux-kvm, linux-lts-xenial, linux-oracle, linux-raspi, linux-raspi2-5.3' package(s) announced via the USN-5014-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.186.195
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'linux, linux-aws, linux-azure, linux-gcp, linux-gke-5.3, linux-hwe, linux-kvm, linux-lts-xenial, linux-oracle, linux-raspi, linux-raspi2-5.3' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 21.04.

Vulnerability Insight
It was discovered that the virtual file system implementation in the Linux kernel contained an unsigned to signed integer conversion error. A local attacker could use this to cause a denial of service (system crash) or execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Dmitry Vyukov discovered that the key management subsystem in the Linux kernel did not properly restrict adding a key that already exists but is negatively instantiated. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2015-8539)
It was discovered that a use-after-free vulnerability existed in the device driver for XCeive xc2028/xc3028 tuners in the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2016-7913)
Pengfei Ding (Ding Peng Fei), Chenfu Bao (Bao Chen Fu), and Lenx Wei (Wei Tao) discovered a race condition in the generic SCSI driver (sg) of the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-0794)
Eric Biggers discovered that the key management subsystem in the Linux kernel did not properly restrict adding a key that already exists but is uninstantiated. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2017-15299)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that a NULL pointer dereference could be triggered in the OCFS2 file system implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system crash). (CVE-2017-18216)
Luo Quan and Wei Yang discovered that a race condition existed in the Advanced Linux Sound Architecture (ALSA) subsystem of the Linux kernel when handling ioctl()s. A local attacker could use this to cause a denial of service (system deadlock). (CVE-2018-1000004)
Fan Long Fei discovered that a race condition existed in the Advanced Linux Sound Architecture (ALSA) subsystem of the Linux kernel that could lead to a use- after-free or an out-of-bounds buffer access. A local attacker with access to /dev/snd/seq could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-7566)
It was discovered that a buffer overflow existed in the NFC Logical Link Control Protocol (llcp) implementation in the Linux kernel. An attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2018-9518)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-5039-1)

Summary

The remote host is missing an update for the 'linux, linux-aws, linux-kvm, linux-lts-xenial' package(s) announced via the USN-5039-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:    linux-image-generic
Installed version:     linux-image-generic-3.13.0.24.28
```

. . . continues on next page . . .

. . . continued from previous page . . .

Fixed version: >=linux-image-generic-3.13.0.187.196

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux, linux-aws, linux-kvm, linux-lts-xenial' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
Andy Nguyen discovered that the netfilter subsystem in the Linux kernel contained an out-of-bounds write in its setsockopt() implementation. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-3250-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3250-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.115.125
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the xfrm framework for transforming packets in the Linux kernel did not properly validate data received from user space. A local attacker could use this to cause a denial of service (system crash) or execute arbitrary code with administrative privileges.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6557-1)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'vim' package(s) announced via the USN-6557-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   vim-tiny
Installed version:    vim-tiny-2:7.4.052-1ubuntu3.1
Fixed version:      >=vim-tiny-2:7.4.052-1ubuntu3.1+esm15
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'vim' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 23.04, Ubuntu 23.10.

Vulnerability Insight
It was discovered that Vim could be made to dereference invalid memory. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 18.04 LTS, Ubuntu 20.04 LTS, and Ubuntu 22.04 LTS. (CVE-2022-1725)
It was discovered that Vim could be made to recurse infinitely. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS, Ubuntu 20.04 LTS, and Ubuntu 22.04 LTS. (CVE-2022-1771)
It was discovered that Vim could be made to write out of bounds with a put command. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 22.04 LTS. (CVE-2022-1886)
It was discovered that Vim could be made to write out of bounds. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 14.04 LTS, Ubuntu 18.04 LTS, Ubuntu 20.04 LTS, and Ubuntu 22.04 LTS. (CVE-2022-1897, CVE-2022-2000)
It was discovered that Vim did not properly manage memory in the spell command. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 22.04 LTS. (CVE-2022-2042)
It was discovered that Vim did not properly manage memory. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2023-46246, CVE-2023-48231)
It was discovered that Vim could be made to divide by zero. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 23.04 and Ubuntu 23.10. (CVE-2023-48232)
It was discovered that Vim contained multiple arithmetic overflows. An attacker could possibly use these issues to cause a denial of service. (CVE-2023-48233, CVE-2023-48234, CVE-2023-48235, CVE-2023-48236, CVE-2023-48237)
It was discovered that Vim did not properly manage memory in the substitute command. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 22.04 LTS, Ubuntu 23.04, and Ubuntu 23.10. (CVE-2023-48706)

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-7986-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-7986-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.210.220
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Several security issues were discovered in the Linux kernel. An attacker could possibly use these to compromise the system. This update corrects flaws in the following subsystems: - Ceph distributed file system, - JFFS2 file system, - Timer subsystem, - USB sound devices, (CVE-2024-26689, CVE-2024-53197, CVE-2024-57850, CVE-2025-38352)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-6166-2)

Summary

The remote host is missing an update for the 'libcap2' package(s) announced via the USN-6166-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libcap2
Installed version:    libcap2-1:2.24-0ubuntu2
Fixed version:      >=libcap2-1:2.24-0ubuntu2+esm1
Vulnerable package:   libcap2-bin
Installed version:    libcap2-bin-1:2.24-0ubuntu2
Fixed version:      >=libcap2-bin-1:2.24-0ubuntu2+esm1
```

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libcap2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6166-1 fixed a vulnerability in libcap2. This update provides the corresponding update for Ubuntu 14.04 ESM, Ubuntu 16.04 ESM and Ubuntu 18.04 ESM.
Original advisory details:
Richard Weinberger discovered that libcap2 incorrectly handled certain long input strings. An attacker could use this issue to cause libcap2 to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2023-2603)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-6166-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2023.6166.2

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-6270-1)

Summary
The remote host is missing an update for the 'vim' package(s) announced via the USN-6270-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Vulnerable package:   vim-tiny
Installed version:    vim-tiny-2:7.4.052-1ubuntu3.1
Fixed version:      >=vim-tiny-2:7.4.052-1ubuntu3.1+esm11
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'vim' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
It was discovered that Vim incorrectly handled memory when opening certain files. If an attacker could trick a user into opening a specially crafted file, it could cause Vim to crash, or possibly execute arbitrary code. This issue only affected Ubuntu 22.04 LTS. (CVE-2022-2182)
It was discovered that Vim incorrectly handled memory when deleting buffers in diff mode. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2022-2208)
It was discovered that Vim incorrectly handled memory access. An attacker could possibly use this issue to cause the corruption of sensitive information, a crash, or arbitrary code execution. This issue only affected Ubuntu 14.04 LTS, Ubuntu 18.04 LTS, Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2022-2210)
It was discovered that Vim incorrectly handled memory when using nested :source. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 22.04 LTS. (CVE-2022-2231)
It was discovered that Vim did not properly perform bounds checks when processing a menu item with the only modifier. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-2257)
It was discovered that Vim incorrectly handled memory when opening certain files. If an attacker could trick a user into opening a specially crafted file, it could cause Vim to crash, or possibly execute arbitrary code. (CVE-2022-2264, CVE-2022-2284, CVE-2022-2289)
It was discovered that Vim did not properly perform bounds checks when going over the end of the typahead. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-2285)
It was discovered that Vim did not properly perform bounds checks when reading the provided string. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-2286)
It was discovered that Vim incorrectly handled memory when adding words with a control character to the internal spell word list. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-2287)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Please install the updated package(s).

Affected Software/OS
'vim' package(s) on Ubuntu 14.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
It was discovered that Vim incorrectly handled memory when opening certain files. If an attacker could trick a user into opening a specially crafted file, it could cause Vim to crash, or possibly execute arbitrary code. This issue only affected Ubuntu 22.04 LTS. (CVE-2022-2522, CVE-2022-2580, CVE-2022-2817, CVE-2022-2819, CVE-2022-2862, CVE-2022-2889, CVE-2022-2982, CVE-2022-3134)
It was discovered that Vim did not properly perform bounds checks in the diff mode in certain situations. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 18.04 LTS, Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2022-2598)
It was discovered that Vim did not properly perform bounds checks in certain situations. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 22.04 LTS. (CVE-2022-2816)
It was discovered that Vim incorrectly handled memory when skipping compiled code. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 22.04 LTS. (CVE-2022-2874)
It was discovered that Vim incorrectly handled memory when opening certain files. If an attacker could trick a user into opening a specially crafted file, it could cause Vim to crash, or possibly execute arbitrary code. This issue only affected Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2022-3016, CVE-2022-3037)
It was discovered that Vim incorrectly handled memory when invalid line number on ':for' is ignored. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-3099)
It was discovered that Vim incorrectly handled memory when passing invalid arguments to the assert_fails() method. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 22.04 LTS. (CVE-2022-3153)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-5995-1)

Summary

The remote host is missing an update for the 'vim' package(s) announced via the USN-5995-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Vulnerable package:   vim-tiny
Installed version:    vim-tiny-2:7.4.052-1ubuntu3.1
Fixed version:      >=vim-tiny-2:7.4.052-1ubuntu3.1+esm8
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'vim' package(s) on Ubuntu 14.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10.

Vulnerability Insight
It was discovered that Vim incorrectly handled memory when opening certain files. If an attacker could trick a user into opening a specially crafted file, it could cause Vim to crash, or possible execute arbitrary code. This issue only affected Ubuntu 14.04 ESM, Ubuntu 18.04 LTS, Ubuntu 20.04 LTS, and Ubuntu 22.04 LTS. (CVE-2022-0413, CVE-2022-1629, CVE-2022-1674, CVE-2022-1733, CVE-2022-1735, CVE-2022-1785, CVE-2022-1796, CVE-2022-1851, CVE-2022-1898, CVE-2022-1942, CVE-2022-1968, CVE-2022-2124, CVE-2022-2125, CVE-2022-2126, CVE-2022-2129, CVE-2022-2175, CVE-2022-2183, CVE-2022-2206, CVE-2022-2304, CVE-2022-2345, CVE-2022-2581)
It was discovered that Vim incorrectly handled memory when opening certain files. If an attacker could trick a user into opening a specially crafted file, it could cause Vim to crash, or possible execute arbitrary code. This issue only affected Ubuntu 18.04 LTS, Ubuntu 20.04 LTS, and Ubuntu 22.04 LTS. (CVE-2022-1720, CVE-2022-2571, CVE-2022-2845, CVE-2022-2849, CVE-2022-2923)
It was discovered that Vim incorrectly handled memory when opening certain files. If an attacker could trick a user into opening a specially crafted file, it could cause Vim to crash, or possible execute arbitrary code. This issue only affected Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2022-1927, CVE-2022-2344)
It was discovered that Vim incorrectly handled memory when opening certain files. If an attacker could trick a user into opening a specially crafted file, it could cause Vim to crash, or possible execute arbitrary code. This issue only affected Ubuntu 18.04 LTS, Ubuntu 20.04 LTS, Ubuntu 22.04 LTS, and Ubuntu 22.10. (CVE-2022-2946)
It was discovered that Vim incorrectly handled memory when opening certain files. If an attacker could trick a user into opening a specially crafted file, it could cause Vim to crash, or possible execute arbitrary code. This issue only affected Ubuntu 20.04 LTS, Ubuntu 22.04 LTS, and Ubuntu 22.10. (CVE-2022-2980)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.8)

NVT: Ubuntu: Security Advisory (USN-7122-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-7122-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.200.210
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
A security issue was discovered in the Linux kernel. An attacker could possibly use this to compromise the system. This update corrects flaws in the following subsystems: - x86 architecture,

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-7122-1)`

Vulnerability Insight

It was discovered that Vim could be made to divide by zero. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 23.04. (CVE-2023-3896)
It was discovered that Vim did not properly manage memory. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2023-4733, CVE-2023-4750)
It was discovered that Vim contained an arithmetic overflow. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 22.04 LTS, Ubuntu 23.04, and Ubuntu 23.10. (CVE-2023-4734)
It was discovered that Vim could be made to write out of bounds. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2023-4735, CVE-2023-5344)
It was discovered that Vim could be made to write out of bounds. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 23.04 and Ubuntu 23.10. (CVE-2023-4738)
It was discovered that Vim could be made to write out of bounds. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS, Ubuntu 20.04 LTS, Ubuntu 22.04 LTS, and Ubuntu 23.04. (CVE-2023-4751)
It was discovered that Vim did not properly manage memory. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 20.04 LTS, Ubuntu 22.04 LTS, Ubuntu 23.04, and Ubuntu 23.10. (CVE-2023-4752, CVE-2023-5535)
It was discovered that Vim could be made to write out of bounds. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. This issue only affected Ubuntu 20.04 LTS, Ubuntu 22.04 LTS, Ubuntu 23.04, and Ubuntu 23.10. (CVE-2023-4781)
It was discovered that Vim could be made to dereference invalid memory. An attacker could possibly use this issue to cause a denial of service. (CVE-2023-5441)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

```

Solution:

Solution type: VendorFix

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered a race condition existed in the Unix domain socket implementation in the Linux kernel, leading to a use-after-free vulnerability. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code. (CVE-2021-0920)
Several security issues were discovered in the Linux kernel. An attacker could possibly use these to compromise the system. This update corrects flaws in the following subsystems: - HID subsystem, - Media drivers, (CVE-2024-50302, CVE-2024-53104)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

. . . continued from previous page . . .

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3168-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.107.115
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Dmitry Vyukov discovered that the KVM implementation in the Linux kernel did not properly initialize the Code Segment (CS) in certain error cases. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2016-9756)
Andrey Konovalov discovered that signed integer overflows existed in the setsockopt() system call when handling the SO_SNDBUFFORCE and SO_RCVBUFFORCE options. A local attacker with the CAP_NET_ADMIN capability could use this to cause a denial of service (system crash or memory corruption). (CVE-2016-9793)
Baozeng Ding discovered a race condition that could lead to a use-after- free in the Advanced Linux Sound Architecture (ALSA) subsystem of the Linux kernel. A local attacker could use this to cause a denial of service (system crash). (CVE-2016-9794)
Baozeng Ding discovered a double free in the netlink_dump() function in the Linux kernel. A local attacker could use this to cause a denial of service (system crash). (CVE-2016-9806)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5519-1)

Summary

The remote host is missing an update for the 'python2.7, python3.4, python3.5, python3.6, python3.8, python3.9, python3.10' package(s) announced via the USN-5519-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm11
Vulnerable package:   python2.7-minimal
Installed version:    python2.7-minimal-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-minimal-2.7.6-8ubuntu0.6+esm11
Vulnerable package:   python3.4
Installed version:    python3.4-3.4.3-1ubuntu1~14.04.7
Fixed version:      >=python3.4-3.4.3-1ubuntu1~14.04.7+esm13
Vulnerable package:   python3.4-minimal
Installed version:    python3.4-minimal-3.4.3-1ubuntu1~14.04.7
Fixed version:      >=python3.4-minimal-3.4.3-1ubuntu1~14.04.7+esm13
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'python2.7, python3.4, python3.5, python3.6, python3.8, python3.9, python3.10' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 21.10, Ubuntu 22.04.

Vulnerability Insight

It was discovered that Python incorrectly handled certain inputs. An attacker could possibly use this issue to execute arbitrary code.

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that memory present in the L1 data cache of an Intel CPU core may be exposed to a malicious process that is executing on the CPU core. This vulnerability is also known as L1 Terminal Fault (L1TF). A local attacker in a guest virtual machine could use this to expose sensitive information (memory from other guests or the host OS). (CVE-2018-3646)
It was discovered that memory present in the L1 data cache of an Intel CPU core may be exposed to a malicious process that is executing on the CPU core. This vulnerability is also known as L1 Terminal Fault (L1TF). A local attacker could use this to expose sensitive information (memory from the kernel or other processes). (CVE-2018-3620)
Andrey Konovalov discovered an out-of-bounds read in the POSIX timers subsystem in the Linux kernel. A local attacker could use this to cause a denial of service (system crash) or expose sensitive information. (CVE-2017-18344)
Juha-Matti Tilli discovered that the TCP implementation in the Linux kernel performed algorithmically expensive operations in some situations when handling incoming packets. A remote attacker could use this to cause a denial of service. (CVE-2018-5390)
Juha-Matti Tilli discovered that the IP implementation in the Linux kernel performed algorithmically expensive operations in some situations when handling incoming packet fragments. A remote attacker could use this to cause a denial of service. (CVE-2018-5391)

```
Installed version:    libgd3-2.1.0-3ubuntu0.11
Fixed version:      >=libgd3-2.1.0-3ubuntu0.11+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libgd2' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4316-1 fixed a vulnerability in GD Graphics Library. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that GD Graphics Library incorrectly handled cloning an image. An attacker could possibly use this issue to cause GD Graphics Library to crash, resulting in a denial of service. (CVE-2018-14553)
It was discovered that GD Graphics Library incorrectly handled loading images from X bitmap format files. An attacker could possibly use this issue to cause GD Graphics Library to crash, resulting in a denial of service, or to disclose contents of the stack that has been left there by previous code. (CVE-2019-11038)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4316-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2020.4316.2

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-5079-4)

Summary
The remote host is missing an update for the 'curl' package(s) announced via the USN-5079-4 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm9
Vulnerable package:   libcurl3
Installed version:    libcurl3-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm9
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm9
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5079-2 fixed vulnerabilities in curl. One of the fixes introduced a regression. This update fixes the problem.
Original advisory details:
Patrick Monnerat discovered that curl incorrectly handled upgrades to TLS. When receiving certain responses from servers, curl would continue without TLS even when the option to require a successful upgrade to TLS was specified. (CVE-2021-22946)
Patrick Monnerat discovered that curl incorrectly handled responses received before STARTTLS. A remote attacker could possibly use this issue to inject responses and intercept communications. (CVE-2021-22947)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5079-4)`

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'heimdal' package(s) announced via the USN-5675-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libgssapi3-heimdal
Installed version:    libgssapi3-heimdal-1.6~git20131207+dfsg-1ubuntu1.2
Fixed version:      >=libgssapi3-heimdal-1.6~git20131207+dfsg-1ubuntu1.2+esm1
Vulnerable package:   libkrb5-26-heimdal
Installed version:    libkrb5-26-heimdal-1.6~git20131207+dfsg-1ubuntu1.2
Fixed version:      >=libkrb5-26-heimdal-1.6~git20131207+dfsg-1ubuntu1.2+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'heimdal' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
Isaac Boukris and Andrew Bartlett discovered that Heimdal's KDC was not properly performing checksum algorithm verifications in the S4U2Self extension module. An attacker could possibly use this issue to perform a machine-in-the-middle attack and request S4U2Self tickets for any user known by the application. This issue only affected Ubuntu 14.04 ESM, Ubuntu 16.04 ESM and Ubuntu 18.04 LTS. (CVE-2018-16860)
It was discovered that Heimdal was not properly handling the verification of key exchanges when an anonymous PKINIT was being used. An attacker could possibly use this issue to perform a machine-in-the-middle attack and expose sensitive information. This issue only affected Ubuntu 14.04 ESM, Ubuntu 16.04 ESM and Ubuntu 18.04 LTS. (CVE-2019-12098)
Joseph Sutton discovered that Heimdal was not properly handling memory management operations when dealing with TGS-REQ tickets that were missing information. An attacker could possibly use this issue to cause a denial of service. (CVE-2021-3671)
Michal Kepien discovered that Heimdal was not properly handling logical conditions that related to memory management operations. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-3116)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-5672-2)

Summary

The remote host is missing an update for the 'gmp' package(s) announced via the USN-5672-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libgmp-dev
Installed version:    libgmp-dev-2:5.1.3+dfsg-1ubuntu1
Fixed version:      >=libgmp-dev-2:5.1.3+dfsg-1ubuntu1+esm1
Vulnerable package:   libgmp10
Installed version:    libgmp10-2:5.1.3+dfsg-1ubuntu1
Fixed version:      >=libgmp10-2:5.1.3+dfsg-1ubuntu1+esm1
Vulnerable package:   libgmpxx4ldbl
Installed version:    libgmpxx4ldbl-2:5.1.3+dfsg-1ubuntu1
Fixed version:      >=libgmpxx4ldbl-2:5.1.3+dfsg-1ubuntu1+esm1
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'gmp' package(s) on Ubuntu 14.04.

. . . continued from previous page . . .

Vulnerability Insight
USN-5672-1 fixed a vulnerability in GMP. This update provides the corresponsing update for Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that GMP did not properly manage memory on 32-bit platforms when processing a specially crafted input. An attacker could possibly use this issue to cause applications using GMP to crash, resulting in a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5672-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2023.5672.2

Vulnerable package:   openssl
Installed version:    openssl-1.0.1f-1ubuntu2.27
Fixed version:      >=openssl-1.0.1f-1ubuntu2.27+esm7
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'openssl, openssl1.0' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10, Ubuntu 23.04.

Vulnerability Insight
It was discovered that OpenSSL was not properly managing file locks when processing policy constraints. If a user or automated system were tricked into processing a certificate chain with specially crafted policy constraints, a remote attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 22.04 LTS and Ubuntu 22.10. (CVE-2022-3996)
David Benjamin discovered that OpenSSL was not properly performing the verification of X.509 certificate chains that include policy constraints, which could lead to excessive resource consumption. If a user or automated system were tricked into processing a specially crafted X.509 certificate chain that includes policy constraints, a remote attacker could possibly use this issue to cause a denial of service. (CVE-2023-0464)
David Benjamin discovered that OpenSSL was not properly handling invalid certificate policies in leaf certificates, which would result in certain policy checks being skipped for the certificate. If a user or automated system were tricked into processing a specially crafted certificate, a remote attacker could possibly use this issue to assert invalid certificate policies and circumvent policy checking. (CVE-2023-0465)
David Benjamin discovered that OpenSSL incorrectly documented the functionalities of function X509_VERIFY_PARAM_add0_policy, stating that it would implicitly enable certificate policy checks when doing certificate verifications, contrary to its implementation. This could cause users and applications to not perform certificate policy checks even when expected to do so. (CVE-2023-0466)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-6039-1)`

NVT: Ubuntu: Security Advisory (USN-4017-2)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'linux, linux-aws, linux-azure, linux-lts-trusty, linux-lts-xenial' package(s) announced via the USN-4017-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.171.182
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux, linux-aws, linux-azure, linux-lts-trusty, linux-lts-xenial' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4017-1 fixed vulnerabilities in the Linux kernel for Ubuntu. This update provides the corresponding updates for the Linux kernel for Ubuntu 16.04 ESM and Ubuntu 14.04 ESM.
Jonathan Looney discovered that the TCP retransmission queue implementation in the Linux kernel could be fragmented when handling certain TCP Selective Acknowledgment (SACK) sequences. A remote attacker could use this to cause a denial of service. (CVE-2019-11478)
Jonathan Looney discovered that an integer overflow existed in the Linux kernel when handling TCP Selective Acknowledgments (SACKs). A remote attacker could use this to cause a denial of service (system crash). (CVE-2019-11477)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm5
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4466-1 fixed a vulnerability in curl. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
Marc Aldorasi discovered that curl incorrectly handled the libcurl CURLOPT_CONNECT_ONLY option. This could result in data being sent to the wrong destination, possibly exposing sensitive information.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4466-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2020.4466.2

Please install the updated package(s).

Affected Software/OS

'python2.7, python3.5, python3.6, python3.8, python3.10, python3.11' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10, Ubuntu 23.04.

Vulnerability Insight

Yebo Cao discovered that Python incorrectly handled certain URLs. An attacker could use this issue to bypass blockinglisting methods. This issue was first addressed in USN-5960-1, but was incomplete. Here we address an additional fix to that issue. (CVE-2023-24329)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

Details: `Ubuntu: Security Advisory (USN-6139-1)`

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-7015-5)

Summary

The remote host is missing an update for the 'python2.7' package(s) announced via the USN-7015-5 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm21
Vulnerable package:   python2.7-minimal
Installed version:    python2.7-minimal-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-minimal-2.7.6-8ubuntu0.6+esm21
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'python2.7' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
USN-7015-1 fixed several vulnerabilities in Python. This update provides the corresponding update for CVE-2024-6232 and CVE-2024-6923 for python2.7 in Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS, Ubuntu 20.04 LTS and Ubuntu 22.04 LTS.
Original advisory details:
It was discovered that the Python email module incorrectly parsed email addresses that contain special characters. A remote attacker could possibly use this issue to bypass certain protection mechanisms. (CVE-2023-27043)
It was discovered that Python allowed excessive backtracking while parsing certain tarfile headers. A remote attacker could possibly use this issue to cause Python to consume resources, leading to a denial of service. (CVE-2024-6232)
It was discovered that the Python email module incorrectly quoted newlines for email headers. A remote attacker could possibly use this issue to perform header injection. (CVE-2024-6923)
It was discovered that the Python http.cookies module incorrectly handled parsing cookies that contained backslashes for quoted characters. A remote attacker could possibly use this issue to cause Python to consume resources, leading to a denial of service. (CVE-2024-7592)
It was discovered that the Python zipfile module incorrectly handled certain malformed zip files. A remote attacker could possibly use this issue to cause Python to stop responding, resulting in a denial of service. (CVE-2024-8088)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

. . . continued from previous page . . .

Affected Software/OS
'openssl, openssl1.0' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
USN-7980-2 fixed vulnerabilities in OpenSSL. This update provides the corresponding updates for CVE-2025-68160 for openssl and openssl1.0, CVE-2025-69418 for openssl on Ubuntu 18.04 LTS and Ubuntu 20.04 LTS, CVE-2025-69419 for openssl on Ubuntu 18.04 LTS and Ubuntu 20.04 LTS, CVE-2025-69420 for openssl on Ubuntu 18.04 LTS and Ubuntu 20.04 LTS, CVE-2025-69421 for openssl and openssl1.0, CVE-2026-22795 for openssl on Ubuntu 18.04 LTS and Ubuntu 20.04 LTS, and CVE-2026-22796 for openssl and openssl1.0.
Original advisory details:
Stanislav Fort, Petr Simecek, and Hamza discovered that OpenSSL incorrectly validated PBMAC1 parameters when doing PKCS#12 MAC verification. An attacker could possibly use this issue to cause OpenSSL to crash, resulting in a denial of service. This issue only affected Ubuntu 25.10. (CVE-2025-11187)
Stanislav Fort discovered that OpenSSL incorrectly parsed CMS AuthEnvelopedData messages. An attacker could possibly use this issue to cause OpenSSL to crash, resulting in a denial of service. (CVE-2025-15467)
Stanislav Fort discovered that OpenSSL incorrectly handled memory in the SSL_CIPHER_find() function. An attacker could possibly use this issue to cause OpenSSL to crash, resulting in a denial of service. This issue only affected Ubuntu 25.10. (CVE-2025-15468)
Stanislav Fort discovered that the OpenSSL 'openssl dgst' command line tool incorrectly truncated data to 16MB. An attacker could posibly use this issue to hide unauthenticated data beyond the 16MB limit. This issue only affected Ubuntu 25.10. (CVE-2025-15469)
Tomas Dulka and Stanislav Fort discovered that OpenSSL incorrectly handled memory with TLS 1.3 connections using certificate compression. An attacker could possibly use this issue to consume resources, leading to a denial of service. This issue only affected Ubuntu 25.10. (CVE-2025-66199)
Petr Simecek and Stanislav Fort discovered that OpenSSL incorrectly handled memory when writing large data into a BIO chain. An attacker could possibly use this issue to consume resources, leading to a denial of service. (CVE-2025-68160)
Stanislav Fort discovered that the OpenSSL OCB API could incorrectly leave final partial blocks unencrypted and unauthenticated. An attacker could possibly use this issue to read or tamper with the affected final bytes. (CVE-2025-69418)
Stanislav Fort discovered that OpenSSL incorrectly handled the PKCS12_get_friendlyname() utf-8 conversion. An attacker could possibly use this issue to cause OpenSSL to crash, resulting in a denial of service. (CVE-2025-69419)
Luigino Camastra discovered that OpenSSL incorrectly handled ASN1_TYPE validation in the TS_RESP_verify_response() function. An attacker could possibly use this issue to cause OpenSSL to crash, resulting in a denial of service. (CVE-2025-69420)
Luigino Camastra discovered that OpenSSL incorrectly handled memory in the ... [Please see the references for more information on the vulnerabilities]

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-5615-3)

Summary

The remote host is missing an update for the 'sqlite3' package(s) announced via the USN-5615-3 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libsqlite3-0
Installed version:    libsqlite3-0-3.8.2-1ubuntu2.2
Fixed version:      >=libsqlite3-0-3.8.2-1ubuntu2.2+esm4
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'sqlite3' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-5615-1 fixed several vulnerabilities in SQLite. This update provides the corresponding fix for CVE-2020-35525 for Ubuntu 14.04 LTS.
Original advisory details:
It was discovered that SQLite incorrectly handled INTERSEC query processing. An attacker could use this issue to cause SQLite to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2020-35525)
It was discovered that SQLite incorrectly handled ALTER TABLE for views that have a nested FROM clause. An attacker could use this issue to cause SQLite to crash, resulting in a denial of service, or possibly execute arbitrary code. This issue was only addressed in Ubuntu 20.04 LTS. (CVE-2020-35527)
It was discovered that SQLite incorrectly handled embedded null characters when tokenizing certain unicode strings. This issue could result in incorrect results. This issue only affected Ubuntu 20.04 LTS. (CVE-2021-20223)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-7015-6)

Summary

The remote host is missing an update for the 'python2.7' package(s) announced via the USN-7015-6 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm22
Vulnerable package:   python2.7-minimal
Installed version:    python2.7-minimal-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-minimal-2.7.6-8ubuntu0.6+esm22
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'python2.7' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
USN-7015-5 fixed vulnerabilities in python2.7. The update introduced several minor regressions. This update fixes the problem.
We apologize for the inconvenience.
Original advisory details:
It was discovered that the Python email module incorrectly parsed email addresses that contain special characters. A remote attacker could possibly use this issue to bypass certain protection mechanisms. (CVE-2023-27043)
It was discovered that Python allowed excessive backtracking while parsing certain tarfile headers. A remote attacker could possibly use this issue to cause Python to consume resources, leading to a denial of service. (CVE-2024-6232)
It was discovered that the Python email module incorrectly quoted newlines for email headers. A remote attacker could possibly use this issue to perform header injection. (CVE-2024-6923)
It was discovered that the Python http.cookies module incorrectly handled parsing cookies that contained backslashes for quoted characters. A remote attacker could possibly use this issue to cause Python to consume resources, leading to a denial of service. (CVE-2024-7592)
It was discovered that the Python zipfile module incorrectly handled certain malformed zip files. A remote attacker could possibly use this issue to cause Python to stop responding, resulting in a denial of service. (CVE-2024-8088)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-5342-2)

Summary
The remote host is missing an update for the 'python2.7' package(s) announced via the USN-5342-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm12
Vulnerable package:   python2.7-minimal
Installed version:    python2.7-minimal-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-minimal-2.7.6-8ubuntu0.6+esm12
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7' package(s) on Ubuntu 14.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
USN-5342-1 fixed several vulnerabilities in Python. This update provides the corresponding update for Ubuntu 14.04 ESM, Ubuntu 20.04 ESM and Ubuntu 22.04 ESM.
Original advisory details:
It was discovered that Python incorrectly handled certain FTP requests. An attacker could possibly use this issue to expose sensitive information. (CVE-2021-4189)
It was discovered that Python incorrectly handled certain inputs. An attacker could possibly use this issue to execute arbitrary code. (CVE-2022-0391)

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-5849-1)

Summary
The remote host is missing an update for the 'heimdal' package(s) announced via the USN-5849-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libgssapi3-heimdal
Installed version:    libgssapi3-heimdal-1.6~git20131207+dfsg-1ubuntu1.2
Fixed version:      >=libgssapi3-heimdal-1.6~git20131207+dfsg-1ubuntu1.2+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'heimdal' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
Helmut Grohne discovered that Heimdal GSSAPI incorrectly handled logical conditions that are related to memory management operations. An attacker could possibly use this issue to cause a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5849-1)`

NVT: Ubuntu: Security Advisory (USN-5523-1)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'tiff' package(s) announced via the USN-5523-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libtiff5
Installed version:    libtiff5-4.0.3-7ubuntu0.11
Fixed version:      >=libtiff5-4.0.3-7ubuntu0.11+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'tiff' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
It was discovered that LibTIFF was not properly performing checks to guarantee that allocated memory space existed, which could lead to a NULL pointer dereference via a specially crafted file. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-0907, CVE-2022-0908)
It was discovered that LibTIFF was not properly performing checks to avoid division calculations where the denominator value was zero, which could lead to an undefined behavior situation via a specially crafted file. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-0909)
It was discovered that LibTIFF was not properly performing bounds checks, which could lead to an out-of-bounds read via a specially crafted file. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. (CVE-2022-0924)
It was discovered that LibTIFF was not properly performing the calculation of data that would eventually be used as a reference for bounds checking operations, which could lead to an out-of-bounds read via a specially crafted file. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. (CVE-2020-19131)
It was discovered that LibTIFF was not properly terminating a function execution when processing incorrect data, which could lead to an out-of-bounds read via a specially crafted file. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. (CVE-2020-19144)
It was discovered that LibTIFF was not properly performing checks when setting the value for data later used as reference during memory access, which could lead to an out-of-bounds read via a specially crafted file. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. (CVE-2022-22844)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Summary

The remote host is missing an update for the 'curl' package(s) announced via the USN-4665-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm6
Vulnerable package:   libcurl3
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version:    libcurl3-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm6
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm6
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4665-1 fixed several vulnerabilities in curl. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
Varnavas Papaioannou discovered that curl incorrectly handled FTP PASV responses. An attacker could possibly use this issue to trick curl into connecting to an arbitrary IP address and be used to perform port scanner and other information gathering. (CVE-2020-8284)
It was discovered that curl incorrectly handled FTP wildcard matchins. A remote attacker could possibly use this issue to cause curl to consume resources and crash, resulting in a denial of service. (CVE-2020-8285)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7018-1)

Summary
The remote host is missing an update for the 'openssl' package(s) announced via the USN-7018-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libssl1.0.0
Installed version:    libssl1.0.0-1.0.1f-1ubuntu2.27
Fixed version:      >=libssl1.0.0-1.0.1f-1ubuntu2.27+esm10
Vulnerable package:   openssl
Installed version:    openssl-1.0.1f-1ubuntu2.27
Fixed version:      >=openssl-1.0.1f-1ubuntu2.27+esm10
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'openssl' package(s) on Ubuntu 14.04.

Vulnerability Insight
Robert Merget, Marcus Brinkmann, Nimrod Aviram, and Juraj Somorovsky discovered that certain Diffie-Hellman ciphersuites in the TLS specification and implemented by OpenSSL contained a flaw. A remote attacker could possibly use this issue to eavesdrop on encrypted communications. This was fixed in this update by removing the insecure ciphersuites from OpenSSL. (CVE-2020-1968)

. . . continues on next page . . .

. . . continued from previous page . . .

Paul Kehrer discovered that OpenSSL incorrectly handled certain input lengths in EVP functions. A remote attacker could possibly use this issue to cause OpenSSL to crash, resulting in a denial of service. (CVE-2021-23840)
Elison Niven discovered that OpenSSL incorrectly handled the c_rehash script. A local attacker could possibly use this issue to execute arbitrary commands when c_rehash is run. (CVE-2022-1292)
Chancen and Daniel Fiala discovered that OpenSSL incorrectly handled the c_rehash script. A local attacker could possibly use this issue to execute arbitrary commands when c_rehash is run. (CVE-2022-2068)
It was discovered that OpenSSL incorrectly handled excessively large Diffie-Hellman parameters. An attacker could possibly use this issue to cause a denial of service. (CVE-2023-3446)
Bahaa Naamneh discovered that OpenSSL incorrectly handled certain malformed PKCS12 files. A remote attacker could possibly use this issue to cause OpenSSL to crash, resulting in a denial of service. (CVE-2024-0727)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-4692-1)

Summary
The remote host is missing an update for the 'tar' package(s) announced via the USN-4692-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   tar
Installed version:    tar-1.27.1-1ubuntu0.1
Fixed version:      >=tar-1.27.1-1ubuntu0.1+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'tar' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 20.10.

Vulnerability Insight
Chris Siebenmann discovered that tar incorrectly handled extracting files resized during extraction when invoked with the –sparse flag. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 12.04 ESM, Ubuntu 14.04 ESM, Ubuntu 16.04 LTS and Ubuntu 18.04 LTS. (CVE-2018-20482)
Daniel Axtens discovered that tar incorrectly handled certain malformed tar files. If a user or automated system were tricked into processing a specially crafted tar archive, a remote attacker could use this issue to cause tar to crash, resulting in a denial of service. (CVE-2019-9923)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4692-1)`

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-6394-2)

Summary
The remote host is missing an update for the 'python2.7' package(s) announced via the USN-6394-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm17
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6394-1 fixed a vulnerability in Python. This update provides the corresponding update for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS and Ubuntu 18.04 LTS.
Original advisory details:
It was discovered that Python incorrectly handled certain scripts. An attacker could possibly use this issue to execute arbitrary code or cause a crash.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-5499-1)

Summary
The remote host is missing an update for the 'curl' package(s) announced via the USN-5499-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm11
Vulnerable package:   libcurl3
Installed version:    libcurl3-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm11
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm11
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

Florian Kohnhuser discovered that curl incorrectly handled returning a TLS server's certificate chain details. A remote attacker could possibly use this issue to cause curl to stop responding, resulting in a denial of service. (CVE-2022-27781)
Harry Sintonen discovered that curl incorrectly handled certain FTP-KRB messages. An attacker could possibly use this to perform a machine-in-the-middle attack. (CVE-2022-32208)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4132-2)

Summary
The remote host is missing an update for the 'expat' package(s) announced via the USN-4132-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libexpat1
Installed version:    libexpat1-2.1.0-4ubuntu1.4
Fixed version:      >=libexpat1-2.1.0-4ubuntu1.4+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'expat' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4132-1 fixed a vulnerability in Expat. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that Expat incorrectly handled certain XML files. An attacker could possibly use this issue to expose sensitive information.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4132-2)`

NVT: Ubuntu: Security Advisory (USN-4049-2)

Summary

The remote host is missing an update for the 'glib2.0' package(s) announced via the USN-4049-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libglib2.0-0
Installed version:    libglib2.0-0-2.40.2-0ubuntu1.1
Fixed version:      >=libglib2.0-0-2.40.2-0ubuntu1.1+esm2
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'glib2.0' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4049-1 fixed a vulnerability in GLib. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that GLib created directories and files without properly restricting permissions. An attacker could possibly use this issue to access sensitive information.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'tiff' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
It was discovered that LibTIFF was not properly performing the calculation of data that would eventually be used as a reference for bound-checking operations. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. This issue only affected Ubuntu 18.04 LTS. (CVE-2020-19131)
It was discovered that LibTIFF was not properly terminating a function execution when processing incorrect data. An attacker could possibly use this issue to cause a denial of service or to expose sensitive information. This issue only affected Ubuntu 18.04 LTS. (CVE-2020-19144)
It was discovered that LibTIFF did not properly manage memory under certain circumstances. If a user were tricked into opening a specially crafted TIFF file using tiffinfo tool, an attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 20.04 LTS and Ubuntu 22.04 LTS. (CVE-2022-1354)

. . . continued from previous page . . .

It was discovered that LibTIFF did not properly manage memory under certain circumstances. If a user were tricked into opening a specially crafted TIFF file using tiffcp tool, an attacker could possibly use this issue to cause a denial of service. (CVE-2022-1355)
It was discovered that LibTIFF was not properly performing checks to avoid division calculations where the denominator value was zero, which could lead to an undefined behaviour situation via a specially crafted file. An attacker could possibly use this issue to cause a denial of service. (CVE-2022-2056, CVE-2022-2057, CVE-2022-2058)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6658-2)

Summary
The remote host is missing an update for the 'libxml2' package(s) announced via the USN-6658-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxml2
Installed version:    libxml2-2.9.1+dfsg1-3ubuntu4.13
Fixed version:      >=libxml2-2.9.1+dfsg1-3ubuntu4.13+esm6
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxml2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6658-1 fixed a vulnerability in libxml2. This update provides the corresponding updates for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, and Ubuntu 18.04 LTS.
Original advisory details:
It was discovered that libxml2 incorrectly handled certain XML documents. A remote attacker could possibly use this issue to cause libxml2 to crash, resulting in a denial of service, or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-3741-1 introduced mitigations in the Linux kernel for Ubuntu 14.04 LTS to address L1 Terminal Fault (L1TF) vulnerabilities (CVE-2018-3620, CVE-2018-3646). Unfortunately, the update introduced regressions that caused kernel panics when booting in some environments as well as preventing Java applications from starting. This update fixes the problems.
We apologize for the inconvenience.
Original advisory details:
It was discovered that memory present in the L1 data cache of an Intel CPU core may be exposed to a malicious process that is executing on the CPU core. This vulnerability is also known as L1 Terminal Fault (L1TF). A local attacker in a guest virtual machine could use this to expose sensitive information (memory from other guests or the host OS). (CVE-2018-3646)
It was discovered that memory present in the L1 data cache of an Intel CPU core may be exposed to a malicious process that is executing on the CPU core. This vulnerability is also known as L1 Terminal Fault (L1TF). A local attacker could use this to expose sensitive information (memory from the kernel or other processes). (CVE-2018-3620)
Juha-Matti Tilli discovered that the TCP implementation in the Linux kernel performed algorithmically expensive operations in some situations when handling incoming packets. A remote attacker could use this to cause a denial of service. (CVE-2018-5390)
Juha-Matti Tilli discovered that the IP implementation in the Linux kernel performed algorithmically expensive operations in some situations when handling incoming packet fragments. A remote attacker could use this to cause a denial of service. (CVE-2018-5391)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'openssl' package(s) announced via the USN-5845-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libssl1.0.0
Installed version:    libssl1.0.0-1.0.1f-1ubuntu2.27
Fixed version:      >=libssl1.0.0-1.0.1f-1ubuntu2.27+esm6
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'openssl' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5845-1 fixed several vulnerabilities in OpenSSL. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
David Benjamin discovered that OpenSSL incorrectly handled X.400 address processing. A remote attacker could possibly use this issue to read arbitrary memory contents or cause OpenSSL to crash, resulting in a denial of service. (CVE-2023-0286)
Octavio Galland and Marcel Bohme discovered that OpenSSL incorrectly handled streaming ASN.1 data. A remote attacker could use this issue to cause OpenSSL to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2023-0215)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.5)

NVT: Ubuntu: Security Advisory (USN-4986-2)

Summary

The remote host is missing an update for the 'rpcbind' package(s) announced via the USN-4986-2 advisory.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   rpcbind
Installed version:    rpcbind-0.2.1-2ubuntu2.2
Fixed version:      >=rpcbind-0.2.1-2ubuntu2.2+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'rpcbind' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-4986-1 fixed a vulnerability in rpcbind. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
It was discovered that rpcbind incorrectly handled certain large data sizes. A remote attacker could use this issue to cause rpcbind to consume resources, leading to a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4986-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2021.4986.2
Version used: `2024-02-02T04:09:01Z`

NVT: Ubuntu: Security Advisory (USN-4409-1)

Summary
The remote host is missing an update for the 'samba' package(s) announced via the USN-4409-1 advisory.

Quality of Detection (QoD): 97%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Vulnerable package:   samba
Installed version:    samba-2:4.3.11+dfsg-0ubuntu0.14.04.20
Fixed version:      >=samba-2:4.3.11+dfsg-0ubuntu0.14.04.20+esm7
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'samba' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 19.10, Ubuntu 20.04.

Vulnerability Insight
Andrew Bartlett discovered that Samba incorrectly handled certain LDAP queries. A remote attacker could use this issue to cause Samba to crash, resulting in a denial of service, or possibly execute arbitrary code. This issue only affected Ubuntu 18.04 LTS, Ubuntu 19.10 and Ubuntu 20.04 LTS. (CVE-2020-10730)
Douglas Bagnall discovered that Samba incorrectly handled certain queries. A remote attacker could possibly use this issue to cause a denial of service. (CVE-2020-10745)
Andrei Popa discovered that Samba incorrectly handled certain LDAP queries. A remote attacker could use this issue to cause Samba to crash, resulting in a denial of service, or possibly execute arbitrary code. This issue only affected Ubuntu 18.04 LTS, Ubuntu 19.10 and Ubuntu 20.04 LTS. (CVE-2020-10760)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5079-2)

Summary
The remote host is missing an update for the 'curl' package(s) announced via the USN-5079-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm8
Vulnerable package:   libcurl3
Installed version:    libcurl3-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm8
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm8
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5079-1 fixed several vulnerabilities in curl. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
Patrick Monnerat discovered that curl incorrectly handled upgrades to TLS. When receiving certain responses from servers, curl would continue without TLS even when the option to require a successful upgrade to TLS was specified. (CVE-2021-22946)
Patrick Monnerat discovered that curl incorrectly handled responses received before STARTTLS. A remote attacker could possibly use this issue to inject responses and intercept communications. (CVE-2021-22947)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5079-2)`

NVT: Ubuntu: Security Advisory (USN-5051-4)

Summary
The remote host is missing an update for the 'openssl' package(s) announced via the USN-5051-4 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libssl1.0.0
Installed version:    libssl1.0.0-1.0.1f-1ubuntu2.27
Fixed version:      >=libssl1.0.0-1.0.1f-1ubuntu2.27+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'openssl' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-5051-2 introduced a regression in OpenSSL that affected only Ubuntu 14.04 ESM. This update fix the regression.
Original advisory details:
Ingo Schwarze discovered that OpenSSL incorrectly handled certain ASN.1 strings. A remote attacker could use this issue to cause OpenSSL to crash, resulting in a denial of service, or possibly obtain sensitive information. (CVE-2021-3712)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: Ubuntu: Security Advisory (USN-5051-4)

High (CVSS: 7.4)

NVT: Ubuntu: Security Advisory (USN-4969-2)

Summary
The remote host is missing an update for the 'isc-dhcp' package(s) announced via the USN-4969-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   isc-dhcp-client
Installed version:    isc-dhcp-client-4.2.4-7ubuntu12.12
Fixed version:      >=isc-dhcp-client-4.2.4-7ubuntu12.13+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'isc-dhcp' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-4969-1 fixed a vulnerability in DHCP. This update provides the corresponding update for Ubuntu 14.04 ESM and 16.04 ESM.
Original advisory details:
Jon Franklin and Pawel Wieczorkiewicz discovered that DHCP incorrectly handled lease file parsing. A remote attacker could possibly use this issue to cause DHCP to crash, resulting in a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4969-2)`

NVT: Ubuntu: Security Advisory (USN-3335-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3335-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.121.131
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the stack guard page for processes in the Linux kernel was not sufficiently large enough to prevent overlapping with the heap. An attacker could leverage this with another vulnerability to execute arbitrary code and gain administrative privileges

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.1)

NVT: Ubuntu: Security Advisory (USN-4392-1)

Summary

The remote host is missing an update for the 'linux, linux-lts-trusty' package(s) announced via the USN-4392-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.180.189
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'linux, linux-lts-trusty' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight

It was discovered that the Marvell WiFi-Ex Driver in the Linux kernel did not properly validate status lengths in messages received from an access point, leading to a buffer overflow. A physically proximate attacker controlling an access point could use this to construct messages that could possibly result in arbitrary code execution. (CVE-2020-12654)

It was discovered that memory contents previously stored in microarchitectural special registers after RDRAND, RDSEED, and SGX EGETKEY read operations on Intel client and Xeon E3 processors may be briefly exposed to processes on the same or different processor cores. A local attacker could use this to expose sensitive information. (CVE-2020-0543)

Piotr Krysiuk discovered that race conditions existed in the file system implementation in the Linux kernel. A local attacker could use this to cause a denial of service (system crash). (CVE-2020-12114)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.1)

NVT: Ubuntu: Security Advisory (USN-5421-1)

Summary

The remote host is missing an update for the 'tiff' package(s) announced via the USN-5421-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libtiff5
Installed version:    libtiff5-4.0.3-7ubuntu0.11
Fixed version:      >=libtiff5-4.0.3-7ubuntu0.11+esm1
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'tiff' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 21.10.

Vulnerability Insight
It was discovered that LibTIFF incorrectly handled certain images. An attacker could possibly use this issue to cause a crash, resulting in a denial of service. This issue only affects Ubuntu 14.04 ESM, Ubuntu 16.04 ESM, Ubuntu 18.04 LTS and Ubuntu 20.04 LTS. (CVE-2020-35522)
Chintan Shah discovered that LibTIFF incorrectly handled memory when handling certain images. An attacker could possibly use this issue to cause a crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2022-0561, CVE-2022-0562, CVE-2022-0891)
It was discovered that LibTIFF incorrectly handled certain images. An attacker could possibly use this issue to cause a crash, resulting in a denial of service. This issue only affects Ubuntu 18.04 LTS, Ubuntu 20.04 LTS and Ubuntu 21.10. (CVE-2022-0865)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.1)

NVT: Ubuntu: Security Advisory (USN-4015-2)

Summary
The remote host is missing an update for the 'dbus' package(s) announced via the USN-4015-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   dbus
Installed version:    dbus-1.6.18-0ubuntu4.4
Fixed version:      >=dbus-1.6.18-0ubuntu4.5+esm1
Vulnerable package:   libdbus-1-3
Installed version:    libdbus-1-3-1.6.18-0ubuntu4.4
Fixed version:      >=libdbus-1-3-1.6.18-0ubuntu4.5+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'dbus' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4015-1 fixed a vulnerability in DBus. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
Joe Vennix discovered that DBus incorrectly handled DBUS_COOKIE_SHA1 authentication. A local attacker could possibly use this issue to bypass authentication and connect to DBus servers with elevated privileges.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6958-1)

Summary
The remote host is missing an update for the 'libcroco' package(s) announced via the USN-6958-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libcroco3
Installed version:    libcroco3-0.6.8-2ubuntu1
Fixed version:      >=libcroco3-0.6.8-2ubuntu1+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libcroco' package(s) on Ubuntu 14.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
It was discovered that Libcroco was incorrectly accessing data structures when reading bytes from memory, which could cause a heap buffer overflow. An attacker could possibly use this issue to cause a denial of service. This issue only affected Ubuntu 14.04 LTS. (CVE-2017-7960)
It was discovered that Libcroco was incorrectly handling invalid UTF-8 values when processing CSS files. An attacker could possibly use this issue to cause a denial of service. (CVE-2017-8834, CVE-2017-8871)
It was discovered that Libcroco was incorrectly implementing recursion in one of its parsing functions, which could cause an infinite recursion loop and a stack overflow due to stack consumption. An attacker could possibly use this issue to cause a denial of service. (CVE-2020-12825)

Summary

The remote host is missing an update for the 'linux' package(s) announced via the USN-7850-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.208.218
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight

Jean-Claude Graf, Sandro Ruegge, Ali Hajiabadi, and Kaveh Razavi discovered that the Linux kernel contained insufficient branch predictor isolation between a guest and a userspace hypervisor for certain processors. This flaw is known as VMSCAPE. An attacker in a guest VM could possibly use this to expose sensitive information from the host OS. (CVE-2025-40300)

A security issues was discovered in the Linux kernel. An attacker could possibly use these to compromise the system. This update corrects flaws in the following subsystem: - USB sound devices, (CVE-2024-53150)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

High (CVSS: 7.0)

NVT: Ubuntu: Security Advisory (USN-6601-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-6601-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.195.205
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
It was discovered that the IGMP protocol implementation in the Linux kernel contained a race condition, leading to a use-after-free vulnerability. A local attacker could use this to cause a denial of service (system crash) or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-6601-1)`

High (CVSS: 7.0)

NVT: Ubuntu: Security Advisory (USN-7714-1)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'open-vm-tools' package(s) announced via the USN-7714-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   open-vm-tools
Installed version:    open-vm-tools-2:9.4.0-1280544-5ubuntu6.4
Fixed version:      >=open-vm-tools-2:9.4.0-1280544-5ubuntu6.4+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'open-vm-tools' package(s) on Ubuntu 14.04.

Vulnerability Insight
Matthias Gerstner discovered that Open VM Tools incorrectly handled file descriptors when dropping privileges. A local attacker could possibly use this issue to hijack /dev/uinput and simulate user inputs. (CVE-2023-34059)
Dolev Farhi discovered that Open VM Tools incorrectly handled certain file permissions. A local attacker could possibly use this issue to setup a symlink attack and override files without authorization. (CVE-2014-4199)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-7714-1)`

NVT: Ubuntu: Security Advisory (USN-7946-2)

Summary
The remote host is missing an update for the 'gnupg' package(s) announced via the USN-7946-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   gnupg
Installed version:    gnupg-1.4.16-1ubuntu2.6
Fixed version:      >=gnupg-1.4.16-1ubuntu2.6+esm2
Vulnerable package:   gpgv
Installed version:    gpgv-1.4.16-1ubuntu2.6
Fixed version:      >=gpgv-1.4.16-1ubuntu2.6+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'gnupg' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-7946-1 fixed vulnerabilities in GnuPG 2.x. This update provides the corresponding updates for GnuPG 1.x.

. . . continues on next page . . .

. . . continued from previous page . . .

Original advisory details: It was discovered that GnuPG incorrectly handled crafted input. A remote attacker could possibly use this issue to crash the program, or execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

2.1.5 High 631/tcp

High (CVSS: 7.5)

NVT: SSL/TLS: Report Vulnerable Cipher Suites for HTTPS

Product detection result
```
cpe:/a:ietf:transport_layer_security
Detected by SSL/TLS: Report Supported Cipher Suites (OID: 1.3.6.1.4.1.25623.1.0.
↪802067)
```

Summary
This routine reports all SSL/TLS cipher suites accepted by a service where attack vectors exists only on HTTPS services.

Quality of Detection (QoD): 98%

Vulnerability Detection Result
```
'Vulnerable' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
'Vulnerable' cipher suites accepted by this service via the TLSv1.1 protocol:
TLS_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)
'Vulnerable' cipher suites accepted by this service via the TLSv1.2 protocol:
```

. . . continues on next page . . .

. . . continued from previous page . . .

TLS_RSA_WITH_3DES_EDE_CBC_SHA (SWEET32)

Impact
This could allow remote attackers to obtain sensitive information or have other, unspecified impacts.

Solution:
Solution type: Mitigation
The configuration of this services should be changed so that it does not accept the listed cipher suites anymore.
Please see the references for more resources supporting you with this task.

Affected Software/OS
All services accepting vulnerable SSL/TLS cipher suites via HTTPS.

Vulnerability Insight
These rules are applied for the evaluation of the vulnerable cipher suites:
- 64-bit block cipher 3DES vulnerable to the SWEET32 attack (CVE-2016-2183).

Vulnerability Detection Method
Checks previous collected cipher suites.

2.1.6 High 6697/tcp

High (CVSS: 8.1)

NVT: UnrealIRCd Authentication Spoofing Vulnerability

Product detection result

```
cpe:/a:unrealircd:unrealircd:3.2.8.1
Detected by UnrealIRCd Detection (OID: 1.3.6.1.4.1.25623.1.0.809884)
```

Summary

UnrealIRCd is prone to authentication spoofing vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 3.2.8.1
Fixed version:     3.2.10.7
```

Impact

Successful exploitation of this vulnerability will allow remote attackers to spoof certificate fingerprints and consequently log in as another user.

Solution:

Solution type: VendorFix

Update to version 3.2.10.7, 4.0.6 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
UnrealIRCd before 3.2.10.7 and 4.x before 4.0.6.

Vulnerability Insight
The flaw exists due to an error in the 'm_authenticate' function in 'modules/m_sasl.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `UnrealIRCd Authentication Spoofing Vulnerability`

`Detected by UnrealIRCd Detection (OID: 1.3.6.1.4.1.25623.1.0.809884)`

Summary
Detection of backdoor in UnrealIRCd.

Quality of Detection (QoD): 70%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Install latest version of unrealircd and check signatures of software you're installing.

Affected Software/OS
The issue affects Unreal 3.2.8.1 for Linux. Reportedly package Unreal3.2.8.1.tar.gz downloaded in November 2009 and later is affected. The MD5 sum of the affected file is 752e46f2d873c1679fa99de3f52a274d. Files with MD5 sum of 7b741e94e867c0a7370553fd01506c66 are not affected.

Vulnerability Insight
Remote attackers can exploit this issue to execute arbitrary system commands within the context of the affected application.

Vulnerability Detection Method
Details: `UnrealIRCd Backdoor`
OID:1.3.6.1.4.1.25623.1.0.80111
Version used: `2025-03-21T05:38:29Z`

Product Detection Result
Product: `cpe:/a:unrealircd:unrealircd:3.2.8.1`
Method: `UnrealIRCd Detection`
OID: 1.3.6.1.4.1.25623.1.0.809884)

2.1.7 High 21/tcp

High (CVSS: 7.5)

NVT: FTP Brute Force Logins With Default Credentials Reporting

Summary
It was possible to login into the remote FTP server using weak/known credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result
`It was possible to login with the following credentials <User>:<Password>`

. . . continues on next page . . .

. . . continued from previous page . . .

`vagrant:vagrant`

Impact
This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.

Solution:
Solution type: Mitigation
Change the password as soon as possible.

Vulnerability Insight
The following devices are / software is known to be affected:
- CVE-2001-1594: Codonics printer FTP service as used in GE Healthcare eNTEGRA P&R
- CVE-2013-7404: GE Healthcare Discovery NM 750b
- CVE-2014-9198: Schneider Electric ETG3000 FactoryCast HMI gateways
- CVE-2015-7261: QNAP iArtist Lite distributed with QNAP Signage Station
- CVE-2016-8731: Foscam C1 devices
- CVE-2017-8218: vsftpd on TP-Link C2 and C20i devices
- CVE-2018-9068: IMM2 for IBM and Lenovo System x
- CVE-2018-17771: Ingenico Telium 2 PoS terminals
- CVE-2018-19063, CVE-2018-19064: Foscam C2 and Opticam i5 devices
- CVE-2018-25147: Microhard Systems IPn4G
- CVE-2020-36915: Adtec Digital SignEdje Digital Signage Player

Note: As the VT 'FTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108717) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

Vulnerability Detection Method
Reports weak/known credentials detected by the VT 'FTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108717).
Details: `FTP Brute Force Logins With Default Credentials Reporting`
OID:1.3.6.1.4.1.25623.1.0.108718
Version used: `2026-01-16T15:42:49Z`

2.1.8 High 80/tcp

High (CVSS: 7.5)

NVT: Test HTTP dangerous methods

Summary
Misconfigured web servers allows remote clients to perform dangerous HTTP methods such as PUT and DELETE.

Quality of Detection (QoD): 99%

Vulnerability Detection Result

```
We could upload the following files via the PUT method at this web server:
http://10.104.2.154/uploads/puttest1906020515.html
We could delete the following files via the DELETE method at this web server:
http://10.104.2.154/uploads/puttest1906020515.html
```

Impact
- Enabled PUT method: This might allow an attacker to upload and run arbitrary code on this web server.
- Enabled DELETE method: This might allow an attacker to delete additional files on this web server.

Solution:
Solution type: Mitigation
Use access restrictions to these dangerous HTTP methods or disable them completely.

Affected Software/OS
Web servers with enabled PUT and/or DELETE methods.

Vulnerability Detection Method
Checks if dangerous HTTP methods such as PUT and DELETE are enabled and can be misused to upload or delete files.
Details: `Test HTTP dangerous methods`
OID:1.3.6.1.4.1.25623.1.0.10498

2.1.9 Medium package

Medium (CVSS: 6.9)

NVT: Ubuntu: Security Advisory (USN-2204-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-2204-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-3.13.0-24-generic
Installed version:    linux-image-3.13.0-24-generic-3.13.0-24.46
Fixed version:      >=linux-image-3.13.0-24-generic-3.13.0-24.47
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
A flaw was discovered in the Linux kernel's pseudo tty (pty) device. An unprivileged user could exploit this flaw to cause a denial of service (system crash) or potentially gain administrator privileges.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: Ubuntu: Security Advisory (USN-2204-1)

NVT: Ubuntu: Security Advisory (USN-4931-1)

Summary

The remote host is missing an update for the 'samba' package(s) announced via the USN-4931-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:    samba
Installed version:     samba-2:4.3.11+dfsg-0ubuntu0.14.04.20
```

. . . continues on next page . . .

. . . continued from previous page . . .

Fixed version: >=samba-2:4.3.11+dfsg-0ubuntu0.14.04.20+esm11

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'samba' package(s) on Ubuntu 14.04.

Vulnerability Insight
Steven French discovered that Samba incorrectly handled ChangeNotify permissions. A remote attacker could possibly use this issue to obtain file name information. (CVE-2020-14318)
Bas Alberts discovered that Samba incorrectly handled certain winbind requests. A remote attacker could possibly use this issue to cause winbind to crash, resulting in a denial of service. (CVE-2020-14323)
Francis Brosnan Blazquez discovered that Samba incorrectly handled certain invalid DNS records. A remote attacker could possibly use this issue to cause the DNS server to crash, resulting in a denial of service. (CVE-2020-14383)
Peter Eriksson discovered that Samba incorrectly handled certain negative idmap cache entries. This issue could result in certain users gaining unauthorized access to files, contrary to expected behaviour. (CVE-2021-20254)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

The remote host is missing an update for the 'nano' package(s) announced via the USN-7064-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   nano
Installed version:    nano-2.2.6-1ubuntu1
Fixed version:      >=nano-2.2.6-1ubuntu1+esm1
```

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Please install the updated package(s).

Affected Software/OS
'nano' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-7064-1 fixed a vulnerability in nano. This update provides the corresponding update for Ubuntu 14.04 LTS.
Original advisory details:
It was discovered that nano allowed a possible privilege escalation through an insecure temporary file. If nano was killed while editing, the permissions granted to the emergency save file could be used by an attacker to escalate privileges using a malicious symlink.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm5
Vulnerable package:   python2.7-minimal
Installed version:    python2.7-minimal-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-minimal-2.7.6-8ubuntu0.6+esm5
Vulnerable package:   python3.4
Installed version:    python3.4-3.4.3-1ubuntu1~14.04.7
Fixed version:      >=python3.4-3.4.3-1ubuntu1~14.04.7+esm6
Vulnerable package:   python3.4-minimal
Installed version:    python3.4-minimal-3.4.3-1ubuntu1~14.04.7
Fixed version:      >=python3.4-minimal-3.4.3-1ubuntu1~14.04.7+esm6
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7, python3.4, python3.5, python3.6, python3.7' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 19.10.

Vulnerability Insight
It was discovered that Python incorrectly stripped certain characters from requests. A remote attacker could use this issue to perform CRLF injection. (CVE-2019-18348)
It was discovered that Python incorrectly handled certain HTTP requests. An attacker could possibly use this issue to cause a denial of service. (CVE-2020-8492)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6229-1)

Summary

The remote host is missing an update for the 'tiff' package(s) announced via the USN-6229-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libtiff5
Installed version:    libtiff5-4.0.3-7ubuntu0.11
Fixed version:      >=libtiff5-4.0.3-7ubuntu0.11+esm8
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

'tiff' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight

It was discovered that LibTIFF was not properly handling variables used to perform memory management operations when processing an image through tiffcrop, which could lead to a heap buffer overflow. An attacker could possibly use this issue to cause a denial of service or execute arbitrary code. (CVE-2023-25433, CVE-2023-26965)

It was discovered that LibTIFF was not properly processing numerical values when dealing with little-endian input data, which could lead to the execution of an invalid operation. An attacker could possibly use this issue to cause a denial of service (CVE-2023-26966)

It was discovered that LibTIFF was not properly performing bounds checks when closing a previously opened TIFF file, which could lead to a NULL pointer dereference. An attacker could possibly use this issue to cause a denial of service. (CVE-2023-3316)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6188-1)

Summary
The remote host is missing an update for the 'openssl' package(s) announced via the USN-6188-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libssl1.0.0
Installed version:    libssl1.0.0-1.0.1f-1ubuntu2.27
Fixed version:      >=libssl1.0.0-1.0.1f-1ubuntu2.27+esm9
Vulnerable package:   openssl
Installed version:    openssl-1.0.1f-1ubuntu2.27
Fixed version:      >=openssl-1.0.1f-1ubuntu2.27+esm9
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'openssl' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
Matt Caswell discovered that OpenSSL incorrectly handled certain ASN.1 object identifiers. A remote attacker could possibly use this issue to cause OpenSSL to consume resources, resulting in a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6944-1 fixed CVE-2024-7264 for Ubuntu 20.04 LTS, Ubuntu 22.04 LTS, and Ubuntu 24.04 LTS. This update provides the corresponding fix for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, and Ubuntu 18.04 LTS.
Original advisory details:
Dov Murik discovered that curl incorrectly handled parsing ASN.1 Generalized Time fields. A remote attacker could use this issue to cause curl to crash, resulting in a denial of service, or possibly obtain sensitive memory contents.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7600-1)

Summary
The remote host is missing an update for the 'libxslt' package(s) announced via the USN-7600-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxslt1.1
Installed version:    libxslt1.1-1.1.28-2ubuntu0.2
Fixed version:      >=libxslt1.1-1.1.28-2ubuntu0.2+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxslt' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
It was discovered that libxslt could be made to expose sensitive information about address space layout. An attacker could possibly use this issue to bypass Address Space Layout Randomization (ASLR) protections.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5658-3)

Summary
The remote host is missing an update for the 'isc-dhcp' package(s) announced via the USN-5658-3 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   isc-dhcp-client
Installed version:    isc-dhcp-client-4.2.4-7ubuntu12.12
Fixed version:      >=isc-dhcp-client-4.2.4-7ubuntu12.13+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'isc-dhcp' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-5658-1 fixed several vulnerabilities in DHCP. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that DHCP incorrectly handled option reference counting. A remote attacker could possibly use this issue to cause DHCP servers to crash, resulting in a denial of service. (CVE-2022-2928)
It was discovered that DHCP incorrectly handled certain memory operations. A remote attacker could possibly use this issue to cause DHCP clients and servers to consume resources, leading to a denial of service. (CVE-2022-2929)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6684-1)

Summary

The remote host is missing an update for the 'ncurses' package(s) announced via the USN-6684-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libncurses5
Installed version:    libncurses5-5.9+20140118-1ubuntu1
Fixed version:      >=libncurses5-5.9+20140118-1ubuntu1+esm5
Vulnerable package:   libtinfo5
Installed version:    libtinfo5-5.9+20140118-1ubuntu1
Fixed version:      >=libtinfo5-5.9+20140118-1ubuntu1+esm5
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'ncurses' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight

It was discovered that ncurses incorrectly handled certain function return values, possibly leading to segmentation fault. A local attacker could possibly use this to cause a denial of service (system crash).

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

Vulnerable package:   samba
Installed version:    samba-2:4.3.11+dfsg-0ubuntu0.14.04.20
Fixed version:      >=samba-2:4.3.11+dfsg-0ubuntu0.14.04.20+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'samba' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4167-1 fixed several vulnerabilities in Samba. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
Michael Hanselmann discovered that the Samba client code incorrectly handled path separators. If a user were tricked into connecting to a malicious server, a remote attacker could use this issue to cause the client to access local pathnames instead of network pathnames. (CVE-2019-10218)
Adam Xu discovered that Samba incorrectly handled the dirsync LDAP control. A remote attacker with 'get changes' permissions could possibly use this issue to cause Samba to crash, resulting in a denial of service. This issue only affected Ubuntu 14.04 ESM. (CVE-2019-14847)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4167-2)`

NVT: Ubuntu: Security Advisory (USN-6028-1)

Summary
The remote host is missing an update for the 'libxml2' package(s) announced via the USN-6028-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxml2
Installed version:    libxml2-2.9.1+dfsg1-3ubuntu4.13
Fixed version:      >=libxml2-2.9.1+dfsg1-3ubuntu4.13+esm5
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxml2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10.

Vulnerability Insight
It was discovered that lixml2 incorrectly handled certain XML files. An attacker could possibly use this issue to cause a crash or execute arbitrary code. (CVE-2023-28484)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that libxml2 incorrectly handled certain XML files. An attacker could possibly use this issue to cause a crash. (CVE-2023-29469)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5742-1)

Summary
The remote host is missing an update for the 'jbigkit' package(s) announced via the USN-5742-1 advisory.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libjbig0
Installed version:    libjbig0-2.0-2ubuntu4.1
Fixed version:      >=libjbig0-2.0-2ubuntu4.1+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'jbigkit' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10.

Vulnerability Insight
It was discovered that JBIG-KIT incorrectly handled decoding certain large image files. If a user or automated system using JBIG-KIT were tricked into opening a specially crafted file, an attacker could possibly use this issue to cause a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

. . . continued from previous page . . .

The remote host is missing an update for the 'libhttp-daemon-perl' package(s) announced via the USN-5520-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libhttp-daemon-perl
Installed version:    libhttp-daemon-perl-6.01-1
Fixed version:      >=libhttp-daemon-perl-6.01-1ubuntu0.14.04~esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libhttp-daemon-perl' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5520-1 fixed a vulnerability in HTTP-Daemon. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
It was discovered that HTTP-Daemon incorrectly handled certain crafted requests. A remote attacker could possibly use this issue to perform an HTTP Request Smuggling attack.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5520-2)`

Vulnerability Insight

It was discovered that jQuery did not correctly handle HTML tags. An attacker could possibly use this issue to execute a cross-site scripting (XSS) attack. This issue only affected Ubuntu 14.04 LTS. (CVE-2012-6708)

It was discovered that jQuery did not correctly handle unsanitized source objects due to prototype pollution. An attacker could possibly use this issue to execute a cross-site scripting (XSS) attack. (CVE-2019-11358)

Masato Kinugawa discovered that jQuery did not correctly sanitize certain HTML elements. An attacker could possibly use this issue to execute a cross-site scripting (XSS) attack. This issue only affected Ubuntu 16.04 LTS and Ubuntu 18.04 LTS. (CVE-2020-11022)

Masato Kinugawa discovered that jQuery did not correctly sanitize certain HTML elements. An attacker could possibly use this issue to execute a cross-site scripting (XSS) attack. This issue only affected Ubuntu 18.04 LTS. (CVE-2020-11023)

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

Details: `Ubuntu: Security Advisory (USN-7622-1)`

Medium (CVSS: 6.1)

NVT: Ubuntu: Security Advisory (USN-3990-2)

Summary

The remote host is missing an update for the 'python-urllib3' package(s) announced via the USN-3990-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python-urllib3
Installed version:    python-urllib3-1.7.1-1ubuntu4.1
Fixed version:      >=python-urllib3-1.7.1-1ubuntu4.1+esm1
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python-urllib3' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-3990-1 fixed a vulnerability in urllib3. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that urllib3 incorrectly stripped certain characters from requests. A remote attacker could use this issue to perform CRLF injection. (CVE-2019-11236)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-3990-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2019.3990.2

Medium (CVSS: 6.1)

NVT: Ubuntu: Security Advisory (USN-6428-1)

Summary
The remote host is missing an update for the 'tiff' package(s) announced via the USN-6428-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libtiff5
Installed version:    libtiff5-4.0.3-7ubuntu0.11
Fixed version:      >=libtiff5-4.0.3-7ubuntu0.11+esm10
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'tiff' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 23.04.

Vulnerability Insight
It was discovered that LibTIFF could be made to read out of bounds when processing certain malformed image files with the tiffcrop utility. If a user were tricked into opening a specially crafted image file, an attacker could possibly use this issue to cause tiffcrop to crash, resulting in a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-6428-1)`
OID:1.3.6.1.4.1.25623.1.1.12.2023.6428.1

Medium (CVSS: 5.9)

NVT: Ubuntu: Security Advisory (USN-4745-1)

Summary
The remote host is missing an update for the 'openssl' package(s) announced via the USN-4745-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libssl1.0.0
Installed version:    libssl1.0.0-1.0.1f-1ubuntu2.27
Fixed version:      >=libssl1.0.0-1.0.1f-1ubuntu2.27+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'openssl' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
David Benjamin discovered that OpenSSL incorrectly handled comparing certificates containing a EDIPartyName name type. A remote attacker could possibly use this issue to cause OpenSSL to crash, resulting in a denial of service. (CVE-2020-1971)
Tavis Ormandy discovered that OpenSSL incorrectly handled parsing issuer fields. A remote attacker could possibly use this issue to cause OpenSSL to crash, resulting in a denial of service. (CVE-2021-23841)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7542-1)

Summary

The remote host is missing an update for the 'krb5' package(s) announced via the USN-7542-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libk5crypto3
Installed version:    libk5crypto3-1.12+dfsg-2ubuntu5.4
Fixed version:      >=libk5crypto3-1.12+dfsg-2ubuntu5.4+esm7
Vulnerable package:   libkrb5-3
Installed version:    libkrb5-3-1.12+dfsg-2ubuntu5.4
Fixed version:      >=libkrb5-3-1.12+dfsg-2ubuntu5.4+esm7
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'krb5' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that Kerberos allowed the usage of weak cryptographic standards. An attacker could possibly use this issue to expose sensitive information.
This update introduces the allow_rc4 and allow_des3 configuration options, and disables the usage of RC4 and 3DES ciphers by default. Users are advised to discontinue their usage and upgrade to stronger encryption protocols. If the use of the insecure RC4 and 3DES algorithms is necessary, they can be enabled with the aforementioned configuration options.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-7542-1)`

```

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
Harry Sintonen and Tomas Hoger discovered that curl incorrectly handled TELNET connections when the -t option was used on the command line. Uninitialized data possibly containing sensitive information could be sent to the remote server, contrary to expectations. This issue was only fixed in Ubuntu 14.04 ESM. (CVE-2021-22898, CVE-2021-22925)
It was discovered that curl incorrectly handled denials when using HTTP proxies. A remote attacker could use this issue to cause curl to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2022-43552)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5894-1)`

NVT: Ubuntu: Security Advisory (USN-6237-3)

Summary

The remote host is missing an update for the 'curl' package(s) announced via the USN-6237-3 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm16
Vulnerable package:   libcurl3
Installed version:    libcurl3-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm16
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
```

. . . continues on next page . . .

. . . continued from previous page . . .

Fixed version: >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm16

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6237-1 fixed several vulnerabilities in curl. This update provides the corresponding updates for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, and Ubuntu 18.04 LTS.
Original advisory details:
Hiroki Kurosawa discovered that curl incorrectly handled validating certain certificate wildcards. A remote attacker could possibly use this issue to spoof certain website certificates using IDN hosts. (CVE-2023-28321)
Hiroki Kurosawa discovered that curl incorrectly handled callbacks when certain options are set by applications. This could cause applications using curl to misbehave, resulting in information disclosure, or a denial of service. (CVE-2023-28322)
It was discovered that curl incorrectly handled saving cookies to files. A local attacker could possibly use this issue to create or overwrite files. This issue only affected Ubuntu 22.10, and Ubuntu 23.04. (CVE-2023-32001)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7974-1)

Summary
The remote host is missing an update for the 'libxml2' package(s) announced via the USN-7974-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxml2
Installed version:    libxml2-2.9.1+dfsg1-3ubuntu4.13
Fixed version:      >=libxml2-2.9.1+dfsg1-3ubuntu4.13+esm11
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxml2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.10.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that libxml2 incorrectly handled maliciously crafted SGML catalog files. An attacker could possibly use this issue to cause libxml2 to consume excessive resources, leading to a denial of service. (CVE-2025-8732)
It was discovered that libxml2 incorrectly handled recursive include directories with the RelaxNG parser. An attacker could possibly use this issue to cause libxml2 to consume excessive resources, leading to a denial of service. (CVE-2026-0989)
Nick Wellnhofer discovered that libxml2 incorrectly parsed catalogs with self-referencing URI delegates. An attacker could possibly use this issue to cause libxml2 to consume excessive resources, leading to a denial of service. (CVE-2026-0990)
Nick Wellnhofer discovered that libxml2 inefficiently parsed catalogs linked with repeating nextCatalog elements. An attacker could possibly use this issue to cause libxml2 to use excessive resources, leading to a denial of service. (CVE-2026-0992)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4376-2)

Summary
The remote host is missing an update for the 'openssl' package(s) announced via the USN-4376-2 advisory.

Quality of Detection (QoD): 97%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Vulnerable package:   libssl1.0.0
Installed version:    libssl1.0.0-1.0.1f-1ubuntu2.27
Fixed version:      >=libssl1.0.0-1.0.1f-1ubuntu2.27+esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'openssl' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4376-1 fixed several vulnerabilities in OpenSSL. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
Cesar Pereida Garcia, Sohaib ul Hassan, Nicola Tuveri, Iaroslav Gridin, Alejandro Cabrera Aldaya, and Billy Brumley discovered that OpenSSL incorrectly handled ECDSA signatures. An attacker could possibly use this issue to perform a timing side-channel attack and recover private ECDSA keys. (CVE-2019-1547)
Juraj Somorovsky, Robert Merget, and Nimrod Aviram discovered that certain applications incorrectly used OpenSSL and could be exposed to a padding oracle attack. A remote attacker could possibly use this issue to decrypt data. (CVE-2019-1559)
Bernd Edlinger discovered that OpenSSL incorrectly handled certain decryption functions. In certain scenarios, a remote attacker could possibly use this issue to perform a padding oracle attack and decrypt traffic. (CVE-2019-1563)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Summary

The remote host is missing an update for the 'linux' package(s) announced via the USN-3524-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:    linux-image-generic
Installed version:     linux-image-generic-3.13.0.24.28
```

. . . continues on next page . . .

. . . continued from previous page . . .

Fixed version: >=linux-image-generic-3.13.0.139.148

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Jann Horn discovered that microprocessors utilizing speculative execution and indirect branch prediction may allow unauthorized memory reads via sidechannel attacks. This flaw is known as Meltdown. A local attacker could use this to expose sensitive information, including kernel memory.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Medium (CVSS: 5.6)

NVT: Ubuntu: Security Advisory (USN-3594-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3594-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.143.153
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-3542-1 mitigated CVE-2017-5715 (Spectre Variant 2) for the amd64 architecture in Ubuntu 14.04 LTS. This update provides the compiler-based retpoline kernel mitigation for the amd64 and i386 architectures. Original advisory details:

. . . continues on next page . . .

. . . continued from previous page . . .

Jann Horn discovered that microprocessors utilizing speculative execution and branch prediction may allow unauthorized memory reads via sidechannel attacks. This flaw is known as Spectre. A local attacker could use this to expose sensitive information, including kernel memory. (CVE-2017-5715)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5923-1)

Summary
The remote host is missing an update for the 'tiff' package(s) announced via the USN-5923-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libtiff5
Installed version:    libtiff5-4.0.3-7ubuntu0.11
Fixed version:      >=libtiff5-4.0.3-7ubuntu0.11+esm7
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'tiff' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 22.10.

Vulnerability Insight
It was discovered that LibTIFF could be made to read out of bounds when processing certain malformed image files with the tiffcrop tool. If a user were tricked into opening a specially crafted image file, an attacker could possibly use this issue to cause tiffcrop to crash, resulting in a denial of service. (CVE-2023-0795, CVE-2023-0796, CVE-2023-0797, CVE-2023-0798, CVE-2023-0799) It was discovered that LibTIFF could be made to write out of bounds when processing certain malformed image files with the tiffcrop tool. If a user were tricked into opening a specially crafted image file, an attacker could possibly use this issue to cause tiffcrop to crash, resulting in a denial of service, or possibly execute arbitrary code. (CVE-2023-0800, CVE-2023-0801, CVE-2023-0802, CVE-2023-0803, CVE-2023-0804)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5923-1)`

Medium (CVSS: 5.5)

NVT: Ubuntu: Security Advisory (USN-3160-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-3160-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.106.114
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
CAI Qian discovered that shared bind mounts in a mount namespace exponentially added entries without restriction to the Linux kernel's mount table. A local attacker could use this to cause a denial of service (system crash). (CVE-2016-6213)
It was discovered that a race condition existed in the procfs environ_read function in the Linux kernel, leading to an integer underflow. A local attacker could use this to expose sensitive information (kernel memory). (CVE-2016-7916)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5733-1)

Summary

The remote host is missing an update for the 'flac' package(s) announced via the USN-5733-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libflac8
Installed version:    libflac8-1.3.0-2ubuntu0.14.04.1
Fixed version:      >=libflac8-1.3.0-2ubuntu0.14.04.1+esm1
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'flac' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that FLAC was not properly performing memory management operations, which could result in a memory leak. An attacker could possibly use this issue to cause FLAC to consume resources, leading to a denial of service. This issue only affected Ubuntu 14.04 ESM, Ubuntu 16.04 ESM and Ubuntu 18.04 LTS. (CVE-2017-6888)
It was discovered that FLAC was not properly performing bounds checking operations when decoding data. If a user or automated system were tricked into processing a specially crafted file, an attacker could possibly use this issue to expose sensitive information or to cause FLAC to crash, leading to a denial of service. This issue only affected Ubuntu 14.04 ESM, Ubuntu 16.04 ESM, Ubuntu 18.04 LTS and Ubuntu 20.04 LTS. (CVE-2020-0499)
It was discovered that FLAC was not properly performing bounds checking operations when encoding data. If a user or automated system were tricked into processing a specially crafted file, an attacker could possibly use this issue to expose sensitive information or to cause FLAC to crash, leading to a denial of service. (CVE-2021-0561)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4398-2)

Summary
The remote host is missing an update for the 'dbus' package(s) announced via the USN-4398-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libdbus-1-3
Installed version:    libdbus-1-3-1.6.18-0ubuntu4.4
Fixed version:      >=libdbus-1-3-1.6.18-0ubuntu4.5+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'dbus' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4398-1 fixed a vulnerability in DBus. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
Kevin Backhouse discovered that DBus incorrectly handled file descriptors. A local attacker could possibly use this issue to cause DBus to crash, resulting in a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4627-1)

Summary
The remote host is missing an update for the 'linux, linux-gcp, linux-gcp-4.15, linux-gcp-5.4, linux-gke-4.15, linux-gke-5.3, linux-hwe, linux-hwe-5.4, linux-lts-trusty, linux-lts-xenial, linux-oem, linux-oem-osp1, linux-oracle, linux-oracle-5.4' package(s) announced via the USN-4627-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.183.192
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux, linux-gcp, linux-gcp-4.15, linux-gcp-5.4, linux-gke-4.15, linux-gke-5.3, linux-hwe, linux-hwe-5.4, linux-lts-trusty, linux-lts-xenial, linux-oem, linux-oem-osp1, linux-oracle, linux-oracle-5.4' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
Moritz Lipp, Michael Schwarz, Andreas Kogler, David Oswald, Catherine Easdon, Claudio Canella, and Daniel Gruss discovered that the Intel Running Average Power Limit (RAPL) driver in the Linux kernel did not properly restrict access to power data. A local attacker could possibly use this to expose sensitive information.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-6588-2)

Summary
The remote host is missing an update for the 'pam' package(s) announced via the USN-6588-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libpam-modules
Installed version:    libpam-modules-1.1.8-1ubuntu2.2
Fixed version:      >=libpam-modules-1.1.8-1ubuntu2.2+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
'pam' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6588-1 fixed a vulnerability in PAM. This update provides the corresponding updates for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, and Ubuntu 18.04 LTS.
Original advisory details:
Matthias Gerstner discovered that the PAM pam_namespace module incorrectly handled special files when performing directory checks. A local attacker could possibly use this issue to cause PAM to stop responding, resulting in a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-6588-2)`

```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python3.4, python3.5, python3.6, python3.7, python3.8, python3.9, python3.10, python3.11, python3.12, python3.13, python3.14' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.10.

Vulnerability Insight
Denis Ledoux discovered that Python incorrectly parsed email message headers. An attacker could possibly use this issue to inject arbitrary headers into email messages. This issue only affected python3.6, python3.7, python3.8, python3.9, python3.10, python3.11, python3.12, python3.13, and python3.14 packages. (CVE-2025-11468)

. . . continues on next page . . .

. . . continued from previous page . . .

Jacob Walls, Shai Berger, and Natalia Bidart discovered that Python inefficiently parsed XML input with quadratic complexity. An attacker could possibly use this issue to cause a denial of service. (CVE-2025-12084)
It was discovered that Python incorrectly parsed malicious plist files. An attacker could possibly use this issue to cause Python to use excessive resources, leading to a denial of service. This issue only affected python3.5, python3.6, python3.7, python3.8, python3.9, python3.10, python3.11, python3.12, python3.13, and python3.14 packages. (CVE-2025-13837)
Omar Hasan discovered that Python incorrectly parsed URL mediatypes. An attacker could possibly use this issue to inject arbitrary HTTP headers. (CVE-2025-15282)
Omar Hasan discovered that Python incorrectly parsed malicious IMAP inputs. An attacker could possibly use this issue to inject arbitrary IMAP commands. (CVE-2025-15366)
Omar Hasan discovered that Python incorrectly parsed malicious POP3 inputs. An attacker could possibly use this issue to inject arbitrary POP3 commands. (CVE-2025-15367)
Omar Hasan discovered that Python incorrectly parsed malicious HTTP cookie headers. An attacker could possibly use this issue to inject arbitrary HTTP headers. (CVE-2026-0672)
Omar Hasan discovered that Python incorrectly parsed malicious HTTP header names and values. An attacker could possibly use this issue to inject arbitrary HTTP headers. (CVE-2026-0865)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

'avahi' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5008-1 fixed a vulnerability in avahi. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
Thomas Kremer discovered that Avahi incorrectly handled termination signals on the Unix socket. A local attacker could possibly use this issue to cause Avahi to hang, resulting in a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5008-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2021.5008.2

Medium (CVSS: 5.5)

NVT: Ubuntu: Security Advisory (USN-7743-1)

Summary
The remote host is missing an update for the 'libxml2' package(s) announced via the USN-7743-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libxml2
Installed version:    libxml2-2.9.1+dfsg1-3ubuntu4.13
Fixed version:      >=libxml2-2.9.1+dfsg1-3ubuntu4.13+esm9
Vulnerable package:   libxml2-dev
Installed version:    libxml2-dev-2.9.1+dfsg1-3ubuntu4.13
Fixed version:      >=libxml2-dev-2.9.1+dfsg1-3ubuntu4.13+esm9
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libxml2' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.04.

Vulnerability Insight
Nikita Sveshnikov discovered that libxml2 incorrectly handled recursion when processing XPath expressions. An attacker could possibly use this issue to cause a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4510-2)

Summary
The remote host is missing an update for the 'samba' package(s) announced via the USN-4510-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   samba
Installed version:    samba-2:4.3.11+dfsg-0ubuntu0.14.04.20
Fixed version:      >=samba-2:4.3.11+dfsg-0ubuntu0.14.04.20+esm9
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'samba' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4510-1 fixed a vulnerability in Samba. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
Tom Tervoort discovered that the Netlogon protocol implemented by Samba incorrectly handled the authentication scheme. A remote attacker could use this issue to forge an authentication token and steal the credentials of the domain admin.
This update fixes the issue by changing the 'server schannel' setting to default to 'yes', instead of 'auto', which will force a secure netlogon channel. This may result in compatibility issues with older devices. A future update may allow a finer-grained control over this setting.

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host is missing an update for the 'samba' package(s) announced via the USN-4217-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libsmbclient
Installed version:    libsmbclient-2:4.3.11+dfsg-0ubuntu0.14.04.20
Fixed version:      >=libsmbclient-2:4.3.11+dfsg-0ubuntu0.14.04.20+esm4
Vulnerable package:   samba
Installed version:    samba-2:4.3.11+dfsg-0ubuntu0.14.04.20
Fixed version:      >=samba-2:4.3.11+dfsg-0ubuntu0.14.04.20+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'samba' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4217-1 fixed several vulnerabilities in Samba. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
Andreas Oster discovered that the Samba DNS management server incorrectly handled certain records. An authenticated attacker could possibly use this issue to crash Samba, resulting in a denial of service. (CVE-2019-14861)
Isaac Boukris discovered that Samba did not enforce the Kerberos DelegationNotAllowed feature restriction, contrary to expectations. (CVE-2019-14870)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4217-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2019.4217.2
Version used: `2024-02-02T04:09:01Z`

Medium (CVSS: 5.3)

NVT: Ubuntu: Security Advisory (USN-4221-1)

Summary
The remote host is missing an update for the 'libpcap' package(s) announced via the USN-4221-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libpcap0.8
Installed version:    libpcap0.8-1.5.3-2
Fixed version:      >=libpcap0.8-1.5.3-2ubuntu0.1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libpcap' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 19.04.

Vulnerability Insight
It was discovered that libpcap did not properly validate PHB headers in some situations. An attacker could use this to cause a denial of service (memory exhaustion).

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4221-1)`
OID:1.3.6.1.4.1.25623.1.1.12.2019.4221.1

NVT: Ubuntu: Security Advisory (USN-4903-1)

Summary
The remote host is missing an update for the 'curl' package(s) announced via the USN-4903-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm7
Vulnerable package:   libcurl3
Installed version:    libcurl3-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm7
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm7
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04.

Vulnerability Insight
Viktor Szakats discovered that curl did not strip off user credentials from referrer header fields. A remote attacker could possibly use this issue to obtain sensitive information.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7015-4)

Summary

The remote host is missing an update for the 'python2.7, python3.5' package(s) announced via the USN-7015-4 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm20
Vulnerable package:   python2.7-minimal
Installed version:    python2.7-minimal-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-minimal-2.7.6-8ubuntu0.6+esm20
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'python2.7, python3.5' package(s) on Ubuntu 14.04.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

USN-7015-1 fixed several vulnerabilities in Python. This update provides the corresponding update for CVE-2023-27043 for python2.7 and python3.5 in Ubuntu 14.04 LTS.
Original advisory details:
It was discovered that the Python email module incorrectly parsed email addresses that contain special characters. A remote attacker could possibly use this issue to bypass certain protection mechanisms. (CVE-2023-27043)
It was discovered that Python allowed excessive backtracking while parsing certain tarfile headers. A remote attacker could possibly use this issue to cause Python to consume resources, leading to a denial of service. (CVE-2024-6232)
It was discovered that the Python email module incorrectly quoted newlines for email headers. A remote attacker could possibly use this issue to perform header injection. (CVE-2024-6923)
It was discovered that the Python http.cookies module incorrectly handled parsing cookies that contained backslashes for quoted characters. A remote attacker could possibly use this issue to cause Python to consume resources, leading to a denial of service. (CVE-2024-7592)
It was discovered that the Python zipfile module incorrectly handled certain malformed zip files. A remote attacker could possibly use this issue to cause Python to stop responding, resulting in a denial of service. (CVE-2024-8088)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-8018-3)

Summary
The remote host is missing an update for the 'python2.7' package(s) announced via the USN-8018-3 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libpython2.7
Installed version:    libpython2.7-2.7.6-8ubuntu0.5
Fixed version:      >=libpython2.7-2.7.6-8ubuntu0.6+esm29
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm29
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
USN-8018-1 fixed CVE-2025-12084, CVE-2025-15282, CVE-2026-0672, CVE-2026-0865 for python3. This update provides the corresponding updates for python2.7.
Original advisory details:
Denis Ledoux discovered that Python incorrectly parsed email message headers. An attacker could possibly use this issue to inject arbitrary headers into email messages. This issue only affected python3.6, python3.7, python3.8, python3.9, python3.10, python3.11, python3.12, python3.13, and python3.14 packages. (CVE-2025-11468)
Jacob Walls, Shai Berger, and Natalia Bidart discovered that Python inefficiently parsed XML input with quadratic complexity. An attacker could possibly use this issue to cause a denial of service. (CVE-2025-12084)

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that Python incorrectly parsed malicious plist files. An attacker could possibly use this issue to cause Python to use excessive resources, leading to a denial of service. This issue only affected python3.5, python3.6, python3.7, python3.8, python3.9, python3.10, python3.11, python3.12, python3.13, and python3.14 packages. (CVE-2025-13837)
Omar Hasan discovered that Python incorrectly parsed URL mediatypes. An attacker could possibly use this issue to inject arbitrary HTTP headers. (CVE-2025-15282)
Omar Hasan discovered that Python incorrectly parsed malicious IMAP inputs. An attacker could possibly use this issue to inject arbitrary IMAP commands. (CVE-2025-15366)
Omar Hasan discovered that Python incorrectly parsed malicious POP3 inputs. An attacker could possibly use this issue to inject arbitrary POP3 commands. (CVE-2025-15367)
Omar Hasan discovered that Python incorrectly parsed malicious HTTP cookie headers. An attacker could possibly use this issue to inject arbitrary HTTP headers. (CVE-2026-0672)
Omar Hasan discovered that Python incorrectly parsed malicious HTTP header names and values. An attacker could possibly use this issue to inject arbitrary HTTP headers. (CVE-2026-0865)

NVT: Ubuntu: Security Advisory (USN-7710-2)

Summary
The remote host is missing an update for the 'python2.7' package(s) announced via the USN-7710-2 advisory.

Quality of Detection (QoD): 97%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Vulnerable package:   libpython2.7
Installed version:    libpython2.7-2.7.6-8ubuntu0.5
Fixed version:      >=libpython2.7-2.7.6-8ubuntu0.6+esm26
Vulnerable package:   python2.7
Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm26
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
USN-7710-1 fixed vulnerabilities in Python. This update provides the corresponding fix for CVE-2025-8194 for Python 2.7.
Original advisory details:
It was discovered that Python inefficiently parsed maliciously crafted HTML input. An attacker could possibly use this issue to cause a denial of service. (CVE-2025-6069)
It was discovered that Python incorrectly parsed maliciously crafted Tar archives. An attacker could possibly use this issue to cause a denial of service. (CVE-2025-8194)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-7710-2)`

Medium (CVSS: 5.0)

NVT: Ubuntu: Security Advisory (USN-6105-2)

Summary
The remote host is missing an update for the 'ca-certificates' package(s) announced via the USN-6105-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   ca-certificates
Installed version:    ca-certificates-20170717~14.04.2
Fixed version:      >=ca-certificates-20230311~14.04.1~esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'ca-certificates' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-6105-1 updated ca-certificates. This provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
The ca-certificates package contained outdated CA certificates. This update refreshes the included certificates to those contained in the 2.60 version of the Mozilla certificate authority bundle.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-6105-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2023.6105.2
Version used: `2023-05-25T04:09:16Z`

Medium (CVSS: 5.0)

NVT: Ubuntu: Security Advisory (USN-7145-1)

Summary
The remote host is missing an update for the 'expat' package(s) announced via the USN-7145-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libexpat1
Installed version:    libexpat1-2.1.0-4ubuntu1.4
Fixed version:      >=libexpat1-2.1.0-4ubuntu1.4+esm10
Vulnerable package:   libexpat1-dev
Installed version:    libexpat1-dev-2.1.0-4ubuntu1.4
Fixed version:      >=libexpat1-dev-2.1.0-4ubuntu1.4+esm10
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'expat' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 24.10.

Vulnerability Insight
It was discovered that Expat did not properly handle its internal state when attempting to resume an unstarted parser. An attacker could use this issue to cause a denial of service (application crash).

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4038-4)

Summary
The remote host is missing an update for the 'bzip2' package(s) announced via the USN-4038-4 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   bzip2
Installed version:    bzip2-1.0.6-5
Fixed version:      >=bzip2-1.0.6-5ubuntu0.1~esm2
Vulnerable package:   libbz2-1.0
Installed version:    libbz2-1.0-1.0.6-5
Fixed version:      >=libbz2-1.0-1.0.6-5ubuntu0.1~esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'bzip2' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4038-1 fixed a vulnerability in bzip2. The update introduced a regression causing bzip2 to incorrect raises CRC errors for some files. This update provides the corresponding update for Ubuntu 12.04 ESM and 14.04 ESM.
We apologize for the inconvenience.
Original advisory details:

. . . continues on next page . . .

. . . continued from previous page . . .

It was discovered that bzip2 incorrectly handled certain files. An attacker could possibly use this issue to execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4038-4)`

Summary
The remote host is missing an update for the 'ca-certificates' package(s) announced via the USN-4377-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   ca-certificates
Installed version:    ca-certificates-20170717~14.04.2
Fixed version:      >=ca-certificates-20190110~14.04.1~esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'ca-certificates' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4377-1 updated ca-certificates. This update provides the corresponding update for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
The ca-certificates package contained an expired CA certificate that caused connectivity issues. This update removes the 'AddTrust External Root' CA.
In addition, on Ubuntu 12.04 ESM and Ubuntu 14.04 ESM, this update refreshes the included certificates to those contained in the 20190110 package.

Summary
The remote host is missing an update for the 'ca-certificates' package(s) announced via the USN-5089-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   ca-certificates
Installed version:    ca-certificates-20170717~14.04.2
Fixed version:      >=ca-certificates-20190110~14.04.1~esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'ca-certificates' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5089-1 updated ca-certificates. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
The ca-certificates package contained a CA certificate that will expire on 2021-09-30 and will cause connectivity issues. This update removes the 'DST Root CA X3' CA.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5089-2)`

NVT: Ubuntu: Security Advisory (USN-7300-1)

Summary
The remote host is missing an update for the 'linux' package(s) announced via the USN-7300-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   linux-image-generic
Installed version:    linux-image-generic-3.13.0.24.28
Fixed version:      >=linux-image-generic-3.13.0.203.213
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'linux' package(s) on Ubuntu 14.04.

Vulnerability Insight
Attila Szasz discovered that the HFS+ file system implementation in the Linux Kernel contained a heap overflow vulnerability. An attacker could use a specially crafted file system image that, when mounted, could cause a denial of service (system crash) or possibly execute arbitrary code.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: Ubuntu: Security Advisory (USN-7300-1)

NVT: Ubuntu: Security Advisory (USN-6279-1)

Summary
The remote host is missing an update for the 'openssh' package(s) announced via the USN-6279-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   openssh-client
Installed version:    openssh-client-1:6.6p1-2ubuntu2.13
Fixed version:      >=openssh-client-1:6.6p1-2ubuntu2.13+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'openssh' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
It was discovered that OpenSSH has an observable discrepancy leading to an information leak in the algorithm negotiation. This update mitigates the issue by tweaking the client hostkey preference ordering algorithm to prefer the default ordering if the user has a key that matches the best-preference default algorithm.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-7967-1)

Summary
The remote host is missing an update for the 'avahi' package(s) announced via the USN-7967-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   avahi-daemon
Installed version:    avahi-daemon-0.6.31-4ubuntu1.3
Fixed version:      >=avahi-daemon-0.6.31-4ubuntu1.3+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'avahi' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.10.

Vulnerability Insight
It was discovered that Avahi incorrectly terminated when processing browser records with wide-area disabled. An attacker could possibly use this issue to cause Avahi to crash, resulting in a denial of service. (CVE-2025-68276)
It was discovered that Avahi incorrectly terminated when processing unsolicited CNAME records pointing to resource records with short TTLs. An attacker could possibly use this issue to cause Avahi to crash, resulting in a denial of service. (CVE-2025-68468)
It was discovered that Avahi incorrectly terminated when processing unsolicited CNAME records in quick succession. An attacker could possibly use this issue to cause Avahi to crash, resulting in a denial of service. (CVE-2025-68471)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Installed version:    python2.7-2.7.6-8ubuntu0.5
Fixed version:      >=python2.7-2.7.6-8ubuntu0.6+esm28
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-7280-2 fixed vulnerabilities in Python. It was discovered that the fixes for CVE-2025-0938 and CVE-2024-11168 were incorrectly applied on Ubuntu 14.04 LTS as a result. This update fixes the problem.
We apologize for the inconvenience.
Original advisory details:
It was discovered that Python incorrectly handled parsing domain names that included square brackets. A remote attacker could possibly use this issue to perform a Server-Side Request Forgery (SSRF) attack.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Vulnerable package:   python3.4-minimal
Installed version:    python3.4-minimal-3.4.3-1ubuntu1~14.04.7
Fixed version:      >=python3.4-minimal-3.4.3-1ubuntu1~14.04.7+esm15
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python2.7, python3.4, python3.6, python3.7, python3.8, python3.9, python3.11, python3.13' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.10.

Vulnerability Insight
USN-7280-1 fixed a vulnerability in Python. This update provides the corresponding updates for some additional Python packages in Ubuntu releases. Original advisory details:
It was discovered that Python incorrectly handled parsing domain names that included square brackets. A remote attacker could possibly use this issue to perform a Server-Side Request Forgery (SSRF) attack.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-7280-2)`

Medium (CVSS: 5.0)

NVT: Ubuntu: Security Advisory (USN-5761-2)

Summary
The remote host is missing an update for the 'ca-certificates' package(s) announced via the USN-5761-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   ca-certificates
Installed version:    ca-certificates-20170717~14.04.2
Fixed version:      >=ca-certificates-20211016~14.04.1~esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'ca-certificates' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
USN-5761-1 updated ca-certificates. This update provides the corresponding update for Ubuntu 14.04 ESM and Ubuntu 16.04 ESM.
Original advisory details:
Due to security concerns, the TrustCor certificate authority has been marked as distrusted in Mozilla's root store. This update removes the TrustCor CA certificates from the ca-certificates package.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-5761-2)`
OID:1.3.6.1.4.1.25623.1.1.12.2022.5761.2

```
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm19
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
USN-8062-1 fixed vulnerabilities in curl. This update provides the corresponding update for CVE-2025-14017, CVE-2025-15079, and CVE-2025-15224 for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS, Ubuntu 18.04 LTS, and Ubuntu 20.04 LTS.
Original advisory details:
It was discovered that curl incorrectly handled cookies when redirected from secure to insecure connections. An attacker could possibly use this issue to cause a denial of service, or obtain sensitive information. This issue only affected Ubuntu 25.10. (CVE-2025-9086)
Calvin Ruocco discovered that curl did not properly handle WebSocket communications under certain circumstances. A malicious server could possibly use this issue to poison proxy caches with malicious content. This issue only affected Ubuntu 24.04 LTS and Ubuntu 25.10. (CVE-2025-10148)
Stanislav Fort discovered that wcurl did not properly handle URLs with certain encoded characters. If a user were tricked into processing a specially crafted URL, an attacker could possibly use this issue to write files outside the intended directory. This issue only affected Ubuntu 25.10. (CVE-2025-11563)
Stanislav Fort discovered that curl did not properly validate pinned public keys under certain circumstances. A remote attacker could possibly use this issue to perform a machine-in-the-middle attack. This issue only affected Ubuntu 25.10.(CVE-2025-13034)
Stanislav Fort discovered that curl did not properly manage TLS options when performing LDAP over TLS transfers in multi-threaded environments. Under certain circumstances, certificate verification could be unintentionally and unknowingly disabled. (CVE-2025-14017)
It was discovered that curl incorrectly handled Oauth2 bearer tokens when following redirects. A remote attacker could possibly use this issue to obtain authentication credentials. (CVE-2025-14524)
Stanislav Fort discovered that curl did not properly validate TLS certificates when reusing connections. A remote attacker could possibly use this issue to bypass expected certificate verification. This issue only affected Ubuntu 24.04 LTS and Ubuntu 25.10. (CVE-2025-14819)
Harry Sintonen discovered that curl did not properly validate SSH host keys when performing SSH-based file transfers. This issue could lead to unintended bypass of custom known_hosts file. This issue only affected Ubuntu 22.04 LTS and Ubuntu 24.04 LTS. (CVE-2025-15079)
Harry Sintonen discovered that curl built with libssh did not properly handle authentication when performing SSH-based file transfers. This could result in unintended authentication operations. This issue only affected Ubuntu 22.04 LTS and Ubuntu 24.04 LTS. (CVE-2025-15224)

```
Vulnerable package:   python3.4
Installed version:    python3.4-3.4.3-1ubuntu1~14.04.7
Fixed version:      >=python3.4-3.4.3-1ubuntu1~14.04.7+esm20
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'python3.4, python3.5, python3.6, python3.7, python3.8, python3.9, python3.10, python3.11, python3.12, python3.13, python3.14' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04, Ubuntu 24.04, Ubuntu 25.10.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

USN-8018-1 fixed vulnerabilities in python3. That update introduced regressions. The patches for CVE-2025-15366 and CVE-2025-15367 caused behavior regressions in IMAP and POP3 handling, which upstream chose to avoid by not backporting them. Additionally, the patch for CVE-2026-0865 incorrectly rejected horizontal tabs in wsgiref headers. This update fixes these problems.
We apologize for the inconvenience.
Original advisory details:
Denis Ledoux discovered that Python incorrectly parsed email message headers. An attacker could possibly use this issue to inject arbitrary headers into email messages. This issue only affected python3.6, python3.7, python3.8, python3.9, python3.10, python3.11, python3.12, python3.13, and python3.14 packages. (CVE-2025-11468)
Jacob Walls, Shai Berger, and Natalia Bidart discovered that Python inefficiently parsed XML input with quadratic complexity. An attacker could possibly use this issue to cause a denial of service. (CVE-2025-12084)
It was discovered that Python incorrectly parsed malicious plist files. An attacker could possibly use this issue to cause Python to use excessive resources, leading to a denial of service. This issue only affected python3.5, python3.6, python3.7, python3.8, python3.9, python3.10, python3.11, python3.12, python3.13, and python3.14 packages. (CVE-2025-13837)
Omar Hasan discovered that Python incorrectly parsed URL mediatypes. An attacker could possibly use this issue to inject arbitrary HTTP headers. (CVE-2025-15282)
Omar Hasan discovered that Python incorrectly parsed malicious IMAP inputs. An attacker could possibly use this issue to inject arbitrary IMAP commands. (CVE-2025-15366)
Omar Hasan discovered that Python incorrectly parsed malicious POP3 inputs. An attacker could possibly use this issue to inject arbitrary POP3 commands. (CVE-2025-15367)
Omar Hasan discovered that Python incorrectly parsed malicious HTTP cookie headers. An attacker could possibly use this issue to inject arbitrary HTTP headers. (CVE-2026-0672)
Omar Hasan discovered that Python incorrectly parsed malicious HTTP header names and values. An attacker could possibly use this issue to inject arbitrary HTTP headers. (CVE-2026-0865)

Medium (CVSS: 5.0)

NVT: Ubuntu: Security Advisory (USN-4360-3)

Summary

The remote host is missing an update for the 'json-c' package(s) announced via the USN-4360-3 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libjson-c2
Installed version:    libjson-c2-0.11-3ubuntu1.2
Fixed version:      >=libjson-c2-0.11-3ubuntu1.2+esm2
Vulnerable package:   libjson0
Installed version:    libjson0-0.11-3ubuntu1.2
Fixed version:      >=libjson0-0.11-3ubuntu1.2+esm2
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'json-c' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight

USN-4360-1 fixed a vulnerability in json-c. The security fix introduced a memory leak in some scenarios. This update reverts the security fix pending further investigation.

We apologize for the inconvenience.

Original advisory details:

It was discovered that json-c incorrectly handled certain JSON files. An attacker could possibly use this issue to execute arbitrary code.

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable package version is present on the target host.

Medium (CVSS: 5.0)

NVT: Ubuntu: Security Advisory (USN-4049-4)

Summary
The remote host is missing an update for the 'glib2.0' package(s) announced via the USN-4049-4 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libglib2.0-0
Installed version:    libglib2.0-0-2.40.2-0ubuntu1.1
Fixed version:      >=libglib2.0-0-2.40.2-0ubuntu1.1+esm3
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'glib2.0' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4049-1 fixed a vulnerability in GLib. The update introduced a regression. This update fixes the problem.
We apologize for the inconvenience.
Original advisory details:
It was discovered that GLib created directories and files without properly restricting permissions. An attacker could possibly use this issue to access sensitive information.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4049-4)`
OID:1.3.6.1.4.1.25623.1.1.12.2019.4049.4

Medium (CVSS: 5.0)

NVT: Ubuntu: Security Advisory (USN-5745-2)

Summary

The remote host is missing an update for the 'shadow' package(s) announced via the USN-5745-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   login
Installed version:    login-1:4.1.5.1-1ubuntu9.5
Fixed version:      >=login-1:4.1.5.1-1ubuntu9.5+esm3
Vulnerable package:   passwd
Installed version:    passwd-1:4.1.5.1-1ubuntu9.5
Fixed version:      >=passwd-1:4.1.5.1-1ubuntu9.5+esm3
```

Solution:

Solution type: VendorFix

Please install the updated package(s).

Affected Software/OS

'shadow' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight

USN-5745-1 fixed vulnerabilities in shadow. Unfortunately that update introduced a regression that caused useradd to behave incorrectly in Ubuntu 14.04 ESM, Ubuntu 16.04 ESM, Ubuntu 18.04 LTS and Ubuntu 20.04 LTS. This update reverts the security fix pending further investigation.

We apologize for the inconvenience.

Original advisory details:

Florian Weimer discovered that shadow was not properly copying and removing user directory trees, which could lead to a race condition. A local attacker could possibly use this issue to setup a symlink attack and alter or remove directories without authorization.

Vulnerability Detection Method

Checks if a vulnerable package version is present on the target host.

Medium (CVSS: 4.7)

NVT: Ubuntu: Security Advisory (USN-4534-1)

Summary
The remote host is missing an update for the 'libdbi-perl' package(s) announced via the USN-4534-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   libdbi-perl
Installed version:    libdbi-perl-1.630-1
Fixed version:      >=libdbi-perl-1.630-1ubuntu0.1~esm5
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'libdbi-perl' package(s) on Ubuntu 12.04, Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
It was discovered that Perl DBI module incorrectly handled certain inputs. An attacker could possibly use this issue to cause a crash or expose sensitive information.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4534-1)`

Medium (CVSS: 4.7)

NVT: Ubuntu: Security Advisory (USN-4247-3)

Summary
The remote host is missing an update for the 'python-apt' package(s) announced via the USN-4247-3 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python-apt
Installed version:    python-apt-0.9.3.5
Fixed version:      >=python-apt-0.9.3.5ubuntu3+esm2
Vulnerable package:   python3-apt
Installed version:    python3-apt-0.9.3.5
Fixed version:      >=python3-apt-0.9.3.5ubuntu3+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python-apt' package(s) on Ubuntu 12.04, Ubuntu 14.04.

Vulnerability Insight
USN-4247-1 fixed several vulnerabilities in python-apt. This update provides the corresponding updates for Ubuntu 12.04 ESM and Ubuntu 14.04 ESM.
Original advisory details:
It was discovered that python-apt would still use MD5 hashes to validate certain downloaded packages. If a remote attacker were able to perform a machine-in-the-middle attack, this flaw could potentially be used to install altered packages. (CVE-2019-15795)
It was discovered that python-apt could install packages from untrusted repositories, contrary to expectations. (CVE-2019-15796)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4247-3)`
OID:1.3.6.1.4.1.25623.1.1.12.2020.4247.3

NVT: Ubuntu: Security Advisory (USN-5737-1)

Summary
The remote host is missing an update for the 'apr-util' package(s) announced via the USN-5737-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result
```
Vulnerable package:   libaprutil1
Installed version:    libaprutil1-1.5.3-1
Fixed version:      >=libaprutil1-1.5.3-1ubuntu0.1~esm1
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'apr-util' package(s) on Ubuntu 14.04, Ubuntu 16.04.

Vulnerability Insight
It was discovered that APR-util did not properly handle memory when using SDBM database files. A local attacker with write access to the database can make a program or process using these functions crash, and cause a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Weak Host Key Algorithm(s) (SSH)

Product detection result

```
cpe:/a:ietf:secure_shell_protocol
Detected by SSH Protocol Algorithms Supported (OID: 1.3.6.1.4.1.25623.1.0.105565
↪)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
The remote SSH server is configured to allow / support weak host key algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSH server supports the following weak host key algorithm(s):
host key algorithm | Description
-----------------------------------------------------------------------------
↪---------
ssh-dss            | Digital Signature Algorithm (DSA) / Digital Signature Stand
↪ard (DSS)
```

Solution:
Solution type: Mitigation
Disable the reported weak host key algorithm(s).

Vulnerability Detection Method
Checks the supported host key algorithms of the remote SSH server.
Currently weak host key algorithms are defined as the following:
- ssh-dss: Digital Signature Algorithm (DSA) / Digital Signature Standard (DSS)
Details: `Weak Host Key Algorithm(s) (SSH)`
OID:1.3.6.1.4.1.25623.1.0.117687
Version used: `2024-06-14T05:05:48Z`

Product Detection Result
Product: `cpe:/a:ietf:secure_shell_protocol`
Method: `SSH Protocol Algorithms Supported`
OID: 1.3.6.1.4.1.25623.1.0.105565)

NVT: Weak Key Exchange (KEX) Algorithm(s) Supported (SSH)

Product detection result

```
cpe:/a:ietf:secure_shell_protocol
Detected by SSH Protocol Algorithms Supported (OID: 1.3.6.1.4.1.25623.1.0.105565
↪)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
The remote SSH server is configured to allow / support weak key exchange (KEX) algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSH server supports the following weak KEX algorithm(s):
KEX algorithm                      | Reason
-------------------------------------------------------------------------------
↪-----------
diffie-hellman-group-exchange-sha1 | Using SHA-1
diffie-hellman-group1-sha1         | Using Oakley Group 2 (a 1024-bit MODP group
↪) and SHA-1
```

Impact
An attacker can quickly break individual connections.

Solution:
Solution type: Mitigation
Disable the reported weak KEX algorithm(s)
- 1024-bit MODP group / prime KEX algorithms:
Alternatively use elliptic-curve Diffie-Hellmann in general, e.g. Curve 25519.

Vulnerability Insight
- 1024-bit MODP group / prime KEX algorithms:
Millions of HTTPS, SSH, and VPN servers all use the same prime numbers for Diffie-Hellman key exchange. Practitioners believed this was safe as long as new key exchange messages were generated for every connection. However, the first step in the number field sieve-the most efficient algorithm for breaking a Diffie-Hellman connection-is dependent only on this prime.
A nation-state can break a 1024-bit prime.

Vulnerability Detection Method
Checks the supported KEX algorithms of the remote SSH server.
Currently weak KEX algorithms are defined as the following:
- non-elliptic-curve Diffie-Hellmann (DH) KEX algorithms with 1024-bit MODP group / prime
- ephemerally generated key exchange groups uses SHA-1
- using RSA 1024-bit modulus key
Details: `Weak Key Exchange (KEX) Algorithm(s) Supported (SSH)`

. . . continued from previous page . . .

```
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se
```

Solution:
Solution type: Mitigation
Disable the reported weak encryption algorithm(s).

Vulnerability Insight
- The 'arcfour' cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.
- The 'none' algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.
- A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.

Vulnerability Detection Method
Checks the supported encryption algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak encryption algorithms are defined as the following:
- Arcfour (RC4) cipher based algorithms
- 'none' algorithm
- CBC mode cipher based algorithms
Details: `Weak Encryption Algorithm(s) Supported (SSH)`
OID:1.3.6.1.4.1.25623.1.0.105611

[return to 10.104.2.154]

2.1.11 Medium 631/tcp

Medium (CVSS: 4.3)

NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Product detection result

```
cpe:/a:ietf:transport_layer_security:1.0
Detected by SSL/TLS: Version Detection (OID: 1.3.6.1.4.1.25623.1.0.105782)
```

Summary

It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

```
In addition to TLSv1.2+ the service is also providing the deprecated TLSv1.0 and
↪ TLSv1.1 protocols and supports one or more ciphers. Those supported ciphers c
↪an be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1
↪.25623.1.0.802067) VT.
```

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:

Solution type: Mitigation

It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols.

Please see the references for more resources supporting you with this task.

Affected Software/OS

- All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols
- CVE-2023-41928: Kiloview P1 4G and P2 4G Video Encoder
- CVE-2024-41270: Gorush v1.18.4
- CVE-2025-3200: Multiple products from Wiesemann & Theis

Vulnerability Insight

The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:

- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)
- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Checks the used TLS protocols of the services provided by this system.

[return to 10.104.2.154]

2.1.12 Medium 21/tcp

Medium (CVSS: 4.8)

NVT: FTP Unencrypted Cleartext Login

Summary
The remote host is running a FTP service that allows cleartext logins over unencrypted connections.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The remote FTP service accepts logins without a previous sent 'AUTH TLS' command
↪. Response(s):
Non-anonymous sessions: 331 Password required for openvasvt
Anonymous sessions:     331 Anonymous login ok, send your complete email address
↪ as your password
```

Impact
An attacker can uncover login names and passwords by sniffing traffic to the FTP service.

Solution:
Solution type: Mitigation
Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.

Vulnerability Detection Method
Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.
Details: `FTP Unencrypted Cleartext Login`
OID:1.3.6.1.4.1.25623.1.0.108528
Version used: `2023-12-20T05:05:58Z`

[return to 10.104.2.154]

2.1.13 Medium 80/tcp

Medium (CVSS: 6.1)

NVT: jQuery < 1.9.0 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 1.6.2
Fixed version:     1.9.0
Installation
path / port:       /phpmyadmin/setup/../js/jquery/jquery-1.6.2.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://10.104.2.154/phpmyadmin/setup/../js/jquery/jquery-1.6.
↪2.js
- Referenced at:   http://10.104.2.154/phpmyadmin/setup/
```

Solution:
Solution type: VendorFix
Update to version 1.9.0 or later.

Affected Software/OS
jQuery prior to version 1.9.0.

Vulnerability Insight
The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.9.0 XSS Vulnerability`

Medium (CVSS: 5.0)

NVT: Sensitive File Disclosure (HTTP)

Summary
The script attempts to identify files containing sensitive data at the remote web server.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The following files containing sensitive information were identified:
Description:   Microsoft IIS / ASP.NET Core Module web.config file accessible. T
↪his could contain sensitive information about the structure of the application
↪ / web server and shouldn't be accessible.
Match:         <configuration>
  <system.webServer>
Used regex:    ^\s*<(configuration|system\.web(Server)?)>
Extra match 1:   </system.webServer>
</configuration>
Used regex:    ^\s*</(configuration|system\.web(Server)?)>
URL:           http://10.104.2.154/drupal/web.config
```

Impact
Based on the information provided in these files an attacker might be able to gather additional info and/or sensitive data like usernames and passwords.

Solution:
Solution type: Mitigation
The sensitive files shouldn't be accessible via a web server. Restrict access to it or remove it completely.

Vulnerability Insight
Currently the script is checking for files like e.g.:
- Software (Blog, CMS) configuration or log files
- Web / application server configuration / password files (e.g. .htaccess, .htpasswd, web.config, web.xml, ...)
- Cloud (e.g. AWS) configuration files
- Files containing API keys for services / providers
- Database backup files (e.g. .sql, ...)
- Editor / history files (e.g. .lesshst, .dbshell, ...)
- SSH or SSL/TLS Private Keys
- Generic environment files (e.g. .env including the ones from Codeigniter, ...)

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2017-16894: Laravel framework specific environment/.env files

Vulnerability Detection Method
Enumerate the remote web server and check if sensitive files are accessible.

NVT: Unprotected Web App / Device Installers (HTTP)

Summary
The script attempts to identify installation/setup pages of various web apps/devices that are publicly accessible and not protected by e.g. account restrictions or having their setup finished.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
The following web app/device installers are unprotected/have not finished their
↪setup and are publicly accessible (URL:Description):
http://10.104.2.154/phpmyadmin/setup/index.php - CubeCart / phpMyAdmin installer
```

Impact
It is possible to install or reconfigure the software. In doing so, the attacker could overwrite existing configurations. It could be possible for the attacker to gain access to the base system

Solution:
Solution type: Mitigation
Setup and/or installation pages for Web Apps should not be publicly accessible via a web server. Restrict access to it, remove it completely or finish the setup of the application / device.

Vulnerability Detection Method
Enumerate the remote web server and check if unprotected web apps/devices are accessible for installation.
Details: `Unprotected Web App / Device Installers (HTTP)`
OID:1.3.6.1.4.1.25623.1.0.107307
Version used: `2025-12-18T05:46:55Z`

Medium (CVSS: 4.8)

NVT: Cleartext Transmission of Sensitive Information via HTTP

Summary
The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
The following input fields were identified (URL:input name):
http://10.104.2.154/drupal/:pass
http://10.104.2.154/drupal/?D=A:pass
http://10.104.2.154/payroll_app.php:password
http://10.104.2.154/phpmyadmin/:pma_password
http://10.104.2.154/phpmyadmin/?D=A:pma_password
http://10.104.2.154/phpmyadmin/changelog.php:pma_password
http://10.104.2.154/phpmyadmin/index.php:pma_password
http://10.104.2.154/phpmyadmin/license.php:pma_password
http://10.104.2.154/phpmyadmin/url.php:pma_password
```

Impact
An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

Solution:
Solution type: Workaround
Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

Affected Software/OS
Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

Vulnerability Detection Method
Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.
The script is currently checking the following:
- HTTP Basic Authentication (Basic Auth)
- HTTP Forms (e.g. Login) with input field of type 'password'
Details: `Cleartext Transmission of Sensitive Information via HTTP`

Medium (CVSS: 4.3)

NVT: jQuery < 1.6.3 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 1.6.2
Fixed version:     1.6.3
Installation
path / port:       /phpmyadmin/setup/../js/jquery/jquery-1.6.2.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://10.104.2.154/phpmyadmin/setup/../js/jquery/jquery-1.6.
↪2.js
- Referenced at:   http://10.104.2.154/phpmyadmin/setup/
```

Solution:
Solution type: VendorFix
Update to version 1.6.3 or later.

Affected Software/OS
jQuery prior to version 1.6.3.

Vulnerability Insight
Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows remote attackers to inject arbitrary web script or HTML via a crafted tag.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.6.3 XSS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.141637
Version used: `2023-07-14T05:06:08Z`

2.1.14 Low package

Low (CVSS: 3.7)

NVT: Ubuntu: Security Advisory (USN-6429-2)

Summary
The remote host is missing an update for the 'curl' package(s) announced via the USN-6429-2 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm17
Vulnerable package:   libcurl3
Installed version:    libcurl3-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm17
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm17
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04.

Vulnerability Insight
USN-6429-1 fixed a vulnerability in curl. This update provides the corresponding update for Ubuntu 14.04 LTS, Ubuntu 16.04 LTS and Ubuntu 18.04 LTS.
Original advisory details:
It was discovered that curl incorrectly handled cookies when an application duplicated certain handles. A local attacker could possibly create a cookie file and inject arbitrary cookies into subsequent connections. (CVE-2023-38546)

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

Low (CVSS: 3.7)

NVT: Ubuntu: Security Advisory (USN-5587-1)

Summary

The remote host is missing an update for the 'curl' package(s) announced via the USN-5587-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   curl
Installed version:    curl-7.35.0-1ubuntu2.20
Fixed version:      >=curl-7.35.0-1ubuntu2.20+esm12
Vulnerable package:   libcurl3
Installed version:    libcurl3-7.35.0-1ubuntu2.20
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:      >=libcurl3-7.35.0-1ubuntu2.20+esm12
Vulnerable package:   libcurl3-gnutls
Installed version:    libcurl3-gnutls-7.35.0-1ubuntu2.20
Fixed version:      >=libcurl3-gnutls-7.35.0-1ubuntu2.20+esm12
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'curl' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04, Ubuntu 22.04.

Vulnerability Insight
Axel Chong discovered that when curl accepted and sent back cookies containing control bytes that a HTTP(S) server might return a 400 (Bad Request Error) response. A malicious cookie host could possibly use this to cause denial-of-service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-5329-1)

Summary
The remote host is missing an update for the 'tar' package(s) announced via the USN-5329-1 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   tar
Installed version:    tar-1.27.1-1ubuntu0.1
Fixed version:      >=tar-1.27.1-1ubuntu0.1+esm2
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'tar' package(s) on Ubuntu 14.04, Ubuntu 16.04, Ubuntu 18.04, Ubuntu 20.04.

Vulnerability Insight
It was discovered that tar incorrectly handled certain files. An attacker could possibly use this issue to cause tar to crash, resulting in a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.

NVT: Ubuntu: Security Advisory (USN-4668-4)

Summary
The remote host is missing an update for the 'python-apt' package(s) announced via the USN-4668-4 advisory.

Quality of Detection (QoD): 97%

Vulnerability Detection Result

```
Vulnerable package:   python-apt
Installed version:    python-apt-0.9.3.5
Fixed version:      >=python-apt-0.9.3.5ubuntu3+esm4
Vulnerable package:   python3-apt
Installed version:    python3-apt-0.9.3.5
Fixed version:      >=python3-apt-0.9.3.5ubuntu3+esm4
```

Solution:
Solution type: VendorFix
Please install the updated package(s).

Affected Software/OS
'python-apt' package(s) on Ubuntu 14.04.

Vulnerability Insight
USN-4668-1 fixed a vulnerability in python-apt. This update provides the corresponding update for Ubuntu 14.04 ESM.
Original advisory details:
Kevin Backhouse discovered that python-apt incorrectly handled resources. A local attacker could possibly use this issue to cause python-apt to consume resources, leading to a denial of service.

Vulnerability Detection Method
Checks if a vulnerable package version is present on the target host.
Details: `Ubuntu: Security Advisory (USN-4668-4)`

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: Mitigation
Disable the reported weak MAC algorithm(s).

Vulnerability Detection Method
Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak MAC algorithms are defined as the following:
- MD5 based algorithms
- 96-bit based algorithms
- 64-bit based algorithms
- 'none' algorithm
